1 Exact diagonalization of the two-site Hubbard model

The Hamiltonian

$$\mathcal{H} = -t \sum_{\sigma} \left(c_{1\sigma}^{\dagger} c_{2\sigma} + c_{2\sigma}^{\dagger} c_{1\sigma} \right) + U \sum_i \hat{n}_{i\uparrow} \hat{n}_{i\downarrow} - \mu \hat{N} \quad (1)$$

a_a I have two lattice sites, indexed by 1 and 2, occupied by electrons. μ is the chemical potential, $c_{i\sigma}^{\dagger}$ and $c_{i\sigma}$ are the fermionic creation and annihilation operators at the i^{th} site, with spin-index σ . σ can take values \uparrow and \downarrow , denoting spin-up and spin-down states respectively. $\hat{n}_{i\sigma} = c_{i\sigma}^{\dagger} c_{i\sigma}$ is the number operator for the i^{th} site and at spin-index σ ; it counts the number of fermions with the designated quantum numbers. $\hat{N} = \sum_{i\sigma} \hat{n}_{i\sigma}$ is the total number operator; it counts the total number of fermions at all sites and spin-indices. t is the hopping strength; the more the t , the more are the electrons likely to hop between sites. U is the on-site repulsion cost; it represents the increase in energy when two electrons occupy the same site.

1.1 Symmetries of the problem

The following operators commute with the Hamiltonian.

1. **Total number operator:** $[\mathcal{H}, \hat{N}] = 0$.

Proof. The last term in the Hamiltonian is the number operator itself. Ignoring that, there are three terms that I need to individually consider.

- $c_{1\sigma}^{\dagger} c_{2\sigma}$

$$\begin{aligned} [c_{1\sigma}^{\dagger} c_{2\sigma}, \hat{n}_{i\sigma'}] &= [c_{1\sigma}^{\dagger} c_{2\sigma}, c_{i\sigma'}^{\dagger} c_{i\sigma'}] \\ &= c_{1\sigma}^{\dagger} [c_{2\sigma}, c_{i\sigma'}^{\dagger} c_{i\sigma'}] + [c_{1\sigma}^{\dagger}, c_{i\sigma'}^{\dagger} c_{i\sigma'}] c_{2\sigma} \\ &= \delta_{i,2} c_{1\sigma}^{\dagger} [c_{2\sigma}, c_{2\sigma'}^{\dagger} c_{2\sigma'}] + \delta_{i,1} [c_{1\sigma}^{\dagger}, c_{1\sigma'}^{\dagger} c_{1\sigma'}] c_{2\sigma} \\ &= \delta_{i,2} c_{1\sigma}^{\dagger} \{c_{2\sigma}, c_{2\sigma'}^{\dagger}\} c_{2\sigma'} - \delta_{i,1} c_{1\sigma}^{\dagger} \{c_{1\sigma'}, c_{1\sigma}^{\dagger}\} c_{2\sigma} \\ &= \delta_{\sigma,\sigma'} c_{1\sigma}^{\dagger} c_{1\sigma} (\delta_{i,2} - \delta_{i,1}) \end{aligned} \quad (2)$$

The third line follows because the electrons on different sites are distinguishable and hence, the *creation and annihilation operators of different sites will commute among themselves*. Therefore,

$$[c_{1\sigma}^{\dagger} c_{2\sigma}, \hat{N}] = \sum_{i\sigma'} [c_{1\sigma}^{\dagger} c_{2\sigma}, \hat{n}_{i\sigma'}] = c_{1\sigma}^{\dagger} c_{1\sigma} \sum_{i=\{1,2\}} (\delta_{i,2} - \delta_{i,1}) = 0 \quad (3)$$

- $c_{2\sigma}^{\dagger} c_{1\sigma}$: Since the operator \hat{N} is symmetric with respect to the site indices 1 and 2, I can go through the last proof again with the site indices 1 and 2 exchanged and since the proof does not depend on the site indices, this commutator will also be zero.

- $\hat{n}_{i\uparrow}\hat{n}_{i\downarrow}$:

$$\begin{aligned}
[\hat{n}_{i\uparrow}\hat{n}_{j\downarrow}, \hat{n}_{j\sigma}] &= \hat{n}_{i\uparrow} [\hat{n}_{i\downarrow}, \hat{n}_{j\sigma}] - [\hat{n}_{i\uparrow}, \hat{n}_{j\sigma}] \hat{n}_{i\downarrow} \\
&= \delta_{ij} (\hat{n}_{i\uparrow} [\hat{n}_{i\downarrow}, \hat{n}_{i\sigma}] - [\hat{n}_{i\uparrow}, \hat{n}_{i\sigma}] \hat{n}_{i\downarrow}) \\
&= \delta_{ij} (\delta_{\sigma\uparrow} \hat{n}_{i\uparrow} [\hat{n}_{i\downarrow}, \hat{n}_{i\uparrow}] - \delta_{\sigma\downarrow} [\hat{n}_{i\uparrow}, \hat{n}_{i\downarrow}] \hat{n}_{i\downarrow}) \\
&= \delta_{ij} (\delta_{\sigma\downarrow} \hat{n}_{i\downarrow} - \delta_{\sigma\uparrow} \hat{n}_{i\uparrow}) [\hat{n}_{i\uparrow}, \hat{n}_{i\downarrow}] \\
&= \delta_{ij} (\delta_{\sigma\downarrow} \hat{n}_{i\downarrow} - \delta_{\sigma\uparrow} \hat{n}_{i\uparrow}) \left(c_{i\uparrow}^\dagger c_{i\uparrow} c_{i\downarrow}^\dagger c_{i\downarrow} - c_{i\downarrow}^\dagger c_{i\downarrow} c_{i\uparrow}^\dagger c_{i\uparrow} \right) \\
&= \delta_{ij} (\delta_{\sigma\downarrow} \hat{n}_{i\downarrow} - \delta_{\sigma\uparrow} \hat{n}_{i\uparrow}) \left(c_{i\downarrow}^\dagger c_{i\downarrow} c_{i\uparrow}^\dagger c_{i\uparrow} - c_{i\uparrow}^\dagger c_{i\uparrow} c_{i\downarrow}^\dagger c_{i\downarrow} \right) = 0
\end{aligned} \tag{4}$$

Therefore, $[\hat{n}_{i\uparrow}\hat{n}_{j\downarrow}, \hat{N}] = \sum_{j,\sigma} [\hat{n}_{i\uparrow}\hat{n}_{j\downarrow}, \hat{n}_{j\sigma}] = 0$

The total Hamiltonian is just a sum of the three terms; since the number operator commutes individually with these terms, it obviously commutes with the total Hamiltonian. \square

2. **Magnetization operator:** $\hat{S}_{tot}^z \equiv \frac{1}{2} \sum_i (\hat{n}_{i\uparrow} - \hat{n}_{i\downarrow})$, $[\mathcal{H}, \hat{S}_{tot}^z] = 0$.

Proof. The magnetization operator can be rewritten as $\hat{S}_{tot}^z = \frac{1}{2} \sum_i (\hat{n}_{i\uparrow} + \hat{n}_{i\downarrow} - 2\hat{n}_{i\downarrow}) = \hat{N} - 2 \sum_i \hat{n}_{i\downarrow}$. Since \hat{N} commutes with \mathcal{H} , I just need to prove that $[\mathcal{H}, \sum_i \hat{n}_{i\downarrow}]$. From eq. 2,

$$\left[c_{1\sigma}^\dagger c_{2\sigma}, \sum_i \hat{n}_{i\downarrow} \right] = c_{1\downarrow}^\dagger c_{1\downarrow} \sum_{i=\{1,2\}} (\delta_{i,2} - \delta_{i,1}) = 0 \tag{5}$$

Again using the symmetry of the magnetization operator with the exchange of indices, its obvious that $[c_{2\sigma}^\dagger c_{1\sigma}, \sum_i \hat{n}_{i\downarrow}] = 0$

Using eq. 4, $[\hat{n}_{i\uparrow}\hat{n}_{i\downarrow}, \hat{n}_{i\downarrow}] = 0$.

Finally, $[N, \hat{n}_{i\downarrow}] = \sum_{j\sigma} [\hat{n}_{j\sigma}, \hat{n}_{i\downarrow}] = [\hat{n}_{i\uparrow}, \hat{n}_{i\downarrow}] = c_{i\uparrow}^\dagger c_{i\uparrow} c_{i\downarrow}^\dagger c_{i\downarrow} - c_{i\downarrow}^\dagger c_{i\downarrow} c_{i\uparrow}^\dagger c_{i\uparrow} = 0$. Since \hat{S}_{tot}^z commutes with each part individually, it commutes with the total Hamiltonian. \square

3. **Two-site parity operator \hat{P} :** The action of \hat{P} is defined as follows. If $|\Psi_{\alpha\beta}\rangle$ is a wavefunction with site indices α and β ,

$$\hat{P} |\Psi(\alpha, \beta)\rangle = |\Psi(\beta, \alpha)\rangle \tag{6}$$

That is, it operates on each electron and reverses it's site indices.

Proof. I now rewrite the Hamiltonian by explicitly showing the two site indices:

$$\mathcal{H}(\alpha, \beta) = -t \sum_{\sigma} (c_{\alpha\sigma}^\dagger c_{\beta\sigma} + c_{\beta\sigma}^\dagger c_{\alpha\sigma}) + U(n_{\alpha\uparrow}n_{\alpha\downarrow} + n_{\beta\uparrow}n_{\beta\downarrow}) - \mu \sum_{\sigma} (n_{\alpha\sigma} + n_{\beta\sigma}) \tag{7}$$

It's obvious that \mathcal{H} is symmetric in the site indices: $\mathcal{H}(\alpha, \beta) = \mathcal{H}(\beta, \alpha)$. This means that the eigenvalues also have this symmetry. Let $|\Phi(\alpha, \beta)\rangle$ be an eigenstate of $\mathcal{H}(\alpha, \beta)$ with eigenvalue $E(\alpha, \beta)$. Then,

$$\begin{aligned}\hat{P}\mathcal{H}|\Phi(\alpha, \beta)\rangle &= E(\alpha, \beta)\hat{P}|\Phi(\alpha, \beta)\rangle = E(\beta, \alpha)|\Phi(\beta, \alpha)\rangle \\ &= \mathcal{H}|\Phi(\beta, \alpha)\rangle = \mathcal{H}\hat{P}|\Phi(\alpha, \beta)\rangle \\ \implies \mathcal{H}\hat{P}|\Phi(\alpha, \beta)\rangle &= \hat{P}\mathcal{H}|\Phi(\alpha, \beta)\rangle\end{aligned}\tag{8}$$

Since any general wavefunction can be expanded in terms of these wavefunctions and since both the operator are linear, the above result will also hold for a general wavefunction $|\Psi(\alpha, \beta)\rangle$:

$$\mathcal{H}\hat{P}|\Psi(\alpha, \beta)\rangle = \hat{P}\mathcal{H}|\Psi(\alpha, \beta)\rangle \implies [\mathcal{H}, \hat{P}] = 0\tag{9}$$

□

1.2 Partitioning the Hilbert space

The Hamiltonian commutes with the three operators. This means that it is possible to simultaneously diagonalize these four operators: $\mathcal{H}, \hat{N}, S_z^{tot}, \hat{P}$. I will be able to label the eigenstates of the total Hamiltonian using the eigenvalues of these operators. First take the total number operator. \hat{N} can take four values for a two-site system, 1 through 4. The eigenstates labelled by a particular number, say $N=2$ will be orthogonal to the eigenstates labelled by another number, say $N=4$. This means each eigenvalue of \hat{N} will have a distinct subspace orthogonal to the other values of \hat{N} . I will be able to diagonalize each such subspace independently of each other, because they will not have any overlap. This feature enables us to block-diagonalize the total Hamiltonian into four blocks, each block belonging to each value \hat{N} .

Inside each block, I will be able to repeat the procedure by next using the eigenvalues of S_z^{tot} . Each block of the Hamiltonian will again break up to smaller blocks for each value of the total magnetization. The eigenvalues of parity operator provide a further partitioning of the blocks of magnetization.

From this point, all the states I will work with will necessarily be eigenfunctions of \hat{N} , so it doesn't make sense to keep the last term in the Hamiltonian, $\mu\hat{N}$. I redefine the Hamiltonian by absorbing this term: $\mathcal{H} \rightarrow \mathcal{H} + \mu\hat{N} = -t \sum_{\sigma} (c_{1\sigma}^\dagger c_{2\sigma} + c_{2\sigma}^\dagger c_{1\sigma}) + U \sum_i \hat{n}_{i\uparrow} \hat{n}_{i\downarrow}$. This will keep the eigenvectors unaltered, but will increase the eigenvalues by μN , where N is the number of particles in the eigenstate I am considering.

1.3 $N = 1$

For writing the state kets, I use the following notation: $|\uparrow, \downarrow\rangle$ means electron on site 1 has spin up and that on site 2 has spin-down. $|\downarrow, 0\rangle$ means electron on site 1 has spin-down and there is no electron on site 2.

For one electron on two lattice sites, I start by writing down the eigenstates of S_z^{tot} . For odd number of electrons, zero magnetization is not possible. So,

- $S_z^{tot} = -1$: $|\downarrow, 0\rangle, |0, \downarrow\rangle$
- $S_z^{tot} = +1$: $|\uparrow, 0\rangle, |0, \uparrow\rangle$

Each eigenvalue will have a separate subspace and can be separately diagonalized. I need to find the matrix elements of \mathcal{H} in these eigenkets. Since there is no possibility of two electrons occupying same site, I ignore the U -term for the time being.

1.3.1 $S_z^{tot} = -1$

Let us first see the action of the Hamiltonian on the eigenfunctions with $S_z^{tot} = -1$.

$$\begin{aligned}\mathcal{H} |\downarrow, 0\rangle &= -tc_{2\downarrow}^\dagger c_{1\downarrow} |\downarrow, 0\rangle = -t |0, \downarrow\rangle \\ \mathcal{H} |0, \downarrow\rangle &= -tc_{1\downarrow}^\dagger c_{2\downarrow} |0, \downarrow\rangle = -t |\downarrow, 0\rangle\end{aligned}\tag{10}$$

We get the following matrix for this tiny subspace of the Hamiltonian:

$$\begin{array}{c} |\downarrow, 0\rangle \quad |0, \downarrow\rangle \\ |\downarrow, 0\rangle \left(\begin{array}{cc} 0 & -t \\ -t & 0 \end{array} \right) \\ |0, \downarrow\rangle \end{array}\tag{11}$$

The eigenvalues and eigenvectors of this matrix are $\frac{|\downarrow, 0\rangle \pm |0, \downarrow\rangle}{\sqrt{2}}$, with eigenvalues $\mp t$. These are also the eigenvalues of the parity operator, as expected.

$$\begin{aligned}\hat{P} (|\downarrow, 0\rangle + |0, \downarrow\rangle) &= |0, \downarrow\rangle + |\downarrow, 0\rangle \implies \hat{P} = 1 \\ \hat{P} (|\downarrow, 0\rangle - |0, \downarrow\rangle) &= |0, \downarrow\rangle - |\downarrow, 0\rangle \implies \hat{P} = -1\end{aligned}\tag{12}$$

1.3.2 $S_z^{tot} = +1$

Now I look at the spin-up states.

$$\begin{aligned}\mathcal{H} |\uparrow, 0\rangle &= -tc_{2\uparrow}^\dagger c_{1\uparrow} |\uparrow, 0\rangle = -t |0, \uparrow\rangle \\ \mathcal{H} |0, \uparrow\rangle &= -tc_{1\uparrow}^\dagger c_{2\uparrow} |0, \uparrow\rangle = -t |\uparrow, 0\rangle\end{aligned}\tag{13}$$

Clearly, this gives the same matrix as the spin-down states:

$$\begin{array}{c} |\uparrow, 0\rangle \quad |0, \uparrow\rangle \\ |\uparrow, 0\rangle \left(\begin{array}{cc} 0 & -t \\ -t & 0 \end{array} \right) \\ |0, \uparrow\rangle \end{array}\tag{14}$$

and hence similar eigenfunctions: $\frac{|\uparrow, 0\rangle \pm |0, \uparrow\rangle}{\sqrt{2}}$, with eigenvalues $\mp t$.

1.4 N=3

I once again write down the eigenstates of S_z^{tot} , this time with three electrons.

- $S_z^{tot} = -1$: $|\uparrow\downarrow, \downarrow\rangle, |\downarrow, \uparrow\downarrow\rangle$
- $S_z^{tot} = +1$: $|\uparrow\downarrow, \uparrow\rangle, |\uparrow, \uparrow\downarrow\rangle$

1.4.1 $S_z^{tot} = -1$

$$\begin{aligned}\mathcal{H}|\uparrow\downarrow, \downarrow\rangle &= -tc_{2\uparrow}^\dagger c_{1\uparrow} |\uparrow\downarrow, \downarrow\rangle + U |\uparrow\downarrow, \downarrow\rangle = -t |\downarrow, \uparrow\downarrow\rangle + U |\uparrow\downarrow, \downarrow\rangle \\ \mathcal{H}|\downarrow, \uparrow\downarrow\rangle &= -tc_{1\uparrow}^\dagger c_{2\uparrow} |\downarrow, \uparrow\downarrow\rangle + U |\downarrow, \uparrow\downarrow\rangle = -t |\uparrow\downarrow, \downarrow\rangle + U |\downarrow, \uparrow\downarrow\rangle\end{aligned}\quad (15)$$

$$\begin{array}{cc} & \begin{array}{cc} |\uparrow\downarrow, \downarrow\rangle & |\downarrow, \uparrow\downarrow\rangle \end{array} \\ \begin{array}{c} |\uparrow\downarrow, \downarrow\rangle \\ |\downarrow, \uparrow\downarrow\rangle \end{array} & \begin{pmatrix} U & -t \\ -t & U \end{pmatrix} \end{array}\quad (16)$$

This matrix has eigenvalues $U \mp t$, and corresponding eigenvectors $\frac{|\uparrow\downarrow, \downarrow\rangle \pm |\downarrow, \uparrow\downarrow\rangle}{\sqrt{2}}$

1.4.2 $S_z^{tot} = +1$

$$\begin{aligned}\mathcal{H}|\uparrow\downarrow, \uparrow\rangle &= -tc_{2\downarrow}^\dagger c_{1\downarrow} |\uparrow\downarrow, \uparrow\rangle + U |\uparrow\downarrow, \uparrow\rangle = tc_{2\downarrow}^\dagger c_{1\downarrow} |\downarrow\uparrow, \uparrow\rangle + U |\uparrow\downarrow, \uparrow\rangle \\ &= t |\uparrow, \downarrow\uparrow\rangle + U |\uparrow\downarrow, \uparrow\rangle = -t |\uparrow, \uparrow\downarrow\rangle + U |\uparrow\downarrow, \uparrow\rangle \\ \mathcal{H}|\uparrow, \uparrow\downarrow\rangle &= -tc_{1\downarrow}^\dagger c_{2\downarrow} |\uparrow, \uparrow\downarrow\rangle + U |\uparrow, \uparrow\downarrow\rangle = tc_{1\downarrow}^\dagger c_{2\downarrow} |\uparrow, \downarrow\uparrow\rangle + U |\uparrow, \uparrow\downarrow\rangle \\ &= t |\downarrow\uparrow, \uparrow\rangle + U |\uparrow, \uparrow\downarrow\rangle = -t |\uparrow\downarrow, \uparrow\rangle + U |\uparrow, \uparrow\downarrow\rangle\end{aligned}\quad (17)$$

$$\begin{array}{cc} & \begin{array}{cc} |\uparrow\downarrow, \uparrow\rangle & |\uparrow, \uparrow\downarrow\rangle \end{array} \\ \begin{array}{c} |\uparrow\downarrow, \uparrow\rangle \\ |\uparrow, \uparrow\downarrow\rangle \end{array} & \begin{pmatrix} U & -t \\ -t & U \end{pmatrix} \end{array}\quad (18)$$

This matrix has eigenvalues $U \mp t$, and corresponding eigenvectors $\frac{|\uparrow\downarrow, \uparrow\rangle \pm |\uparrow, \uparrow\downarrow\rangle}{\sqrt{2}}$

1.5 N=4

With four electrons, the only possible state is $|\uparrow\downarrow, \uparrow\downarrow\rangle$. Its easy to find the eigenvalue. Since all states are filled, no hopping can take place, so the hopping term is zero. Therefore,

$$\mathcal{H}|\uparrow\downarrow, \uparrow\downarrow\rangle = 2U |\uparrow\downarrow, \uparrow\downarrow\rangle \quad (19)$$

So, $|\uparrow\downarrow, \uparrow\downarrow\rangle$ is an eigenvector with eigenvalue $2U$.

1.6 N=2

This is the eigenvalue that has the largest subspace.

- $S_z^{tot} = -1$: $|\downarrow, \downarrow\rangle$
- $S_z^{tot} = +1$: $|\uparrow, \uparrow\rangle$
- $S_z^{tot} = 0$: $|\uparrow, \downarrow\rangle, |\downarrow, \uparrow\rangle, |0, \uparrow\downarrow\rangle, |\uparrow\downarrow, 0\rangle$

1.6.1 $S_z^{tot} = \pm 1$

These two subspaces have a single state each, so they are obviously eigenstates. Since they both have identical spins on both sites, the hopping term is 0, and the U -term is also zero because of single occupation. As a result, they both have zero eigenvalue

$$\mathcal{H} |\downarrow, \downarrow\rangle = \mathcal{H} |\uparrow, \uparrow\rangle = 0 \quad (20)$$

1.6.2 $S_z^{tot} = 0$

This subspace has four eigenvectors,

$$|\uparrow, \downarrow\rangle, \quad |\downarrow, \uparrow\rangle, \quad |0, \uparrow\downarrow\rangle, \quad |\uparrow\downarrow, 0\rangle \quad (21)$$

so it is not possible to directly diagonalize this subspace. First we organize these states into eigenstates of parity. It is easy by inspection.

$$\begin{aligned} \hat{P} (|\uparrow, \downarrow\rangle \pm |\downarrow, \uparrow\rangle) &= \pm (|\uparrow, \downarrow\rangle \pm |\downarrow, \uparrow\rangle) \\ \hat{P} (|\uparrow\downarrow, 0\rangle \pm |0, \uparrow\downarrow\rangle) &= \pm (|\uparrow\downarrow, 0\rangle \pm |0, \uparrow\downarrow\rangle) \end{aligned} \quad (22)$$

I have the parity eigenstates for this subspace, so its most convenient to work in the basis of these eigenstates

- $\hat{P} = 1$: $\frac{|\uparrow, \downarrow\rangle + |\downarrow, \uparrow\rangle}{\sqrt{2}}, \quad \frac{|\uparrow\downarrow, 0\rangle + |0, \uparrow\downarrow\rangle}{\sqrt{2}}$
- $\hat{P} = -1$: $\frac{|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle}{\sqrt{2}}, \quad \frac{|\uparrow\downarrow, 0\rangle - |0, \uparrow\downarrow\rangle}{\sqrt{2}}$

Each eigenvalue subspace can now be diagonalized separately. First I look at the eigenstates of $\hat{P} = 1$. I find the matrix of \mathcal{H} in the subspace spanned by these two vectors and then diagonalize that subspace.

$$\begin{aligned} \mathcal{H} \frac{|\uparrow, \downarrow\rangle + |\downarrow, \uparrow\rangle}{\sqrt{2}} &= -\frac{t}{\sqrt{2}} \left\{ \left(c_{1\downarrow}^\dagger c_{2\downarrow} + c_{2\uparrow}^\dagger c_{1\uparrow} \right) |\uparrow, \downarrow\rangle + \left(c_{1\uparrow}^\dagger c_{2\uparrow} + c_{2\downarrow}^\dagger c_{1\downarrow} \right) |\downarrow, \uparrow\rangle \right\} \\ &= -\frac{t}{\sqrt{2}} \{ |\downarrow\uparrow, 0\rangle + |0, \uparrow\downarrow\rangle + |\uparrow\downarrow, 0\rangle + |0, \downarrow\uparrow\rangle \} = 0 \\ \mathcal{H} \frac{|\uparrow\downarrow, 0\rangle + |0, \uparrow\downarrow\rangle}{\sqrt{2}} &= -\frac{t}{\sqrt{2}} \left\{ \left(c_{2\uparrow}^\dagger c_{1\uparrow} + c_{2\downarrow}^\dagger c_{1\downarrow} \right) |\uparrow\downarrow, 0\rangle + \left(c_{1\uparrow}^\dagger c_{2\uparrow} + c_{1\downarrow}^\dagger c_{2\downarrow} \right) |0, \uparrow\downarrow\rangle \right\} + U \frac{|\uparrow\downarrow, 0\rangle + |0, \uparrow\downarrow\rangle}{\sqrt{2}} \\ &= -\frac{t}{\sqrt{2}} \{ |\downarrow, \uparrow\rangle - |\uparrow, \downarrow\rangle + |\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle \} + U \frac{|\uparrow\downarrow, 0\rangle + |0, \uparrow\downarrow\rangle}{\sqrt{2}} = U \frac{|\uparrow\downarrow, 0\rangle + |0, \uparrow\downarrow\rangle}{\sqrt{2}} \end{aligned} \quad (23)$$

We get the following matrix

$$\begin{array}{c} \frac{|\uparrow,\downarrow\rangle+|\downarrow,\uparrow\rangle}{\sqrt{2}} \\ \frac{|\uparrow\downarrow,0\rangle+|0,\uparrow\downarrow\rangle}{\sqrt{2}} \end{array} \begin{pmatrix} \frac{|\uparrow,\downarrow\rangle+|\downarrow,\uparrow\rangle}{\sqrt{2}} & \frac{|\uparrow\downarrow,0\rangle+|0,\uparrow\downarrow\rangle}{\sqrt{2}} \\ 0 & 0 \\ 0 & U \end{pmatrix} \quad (24)$$

As it appears, the subspace is already diagonal in the eigenbasis of \hat{P} . The $\hat{P} = 1$ eigenstates are eigenstates of \mathcal{H} , with eigenvalues 0 and U . Next I look at the eigenstates of $\hat{P} = -1$.

$$\begin{aligned} \mathcal{H} \frac{|\uparrow,\downarrow\rangle - |\downarrow,\uparrow\rangle}{\sqrt{2}} &= -\frac{t}{\sqrt{2}} \left\{ \left(c_{1\downarrow}^\dagger c_{2\downarrow} c_{2\uparrow}^\dagger c_{1\uparrow} \right) |\uparrow,\downarrow\rangle - \left(c_{1\uparrow}^\dagger c_{2\uparrow} + c_{2\downarrow}^\dagger c_{1\downarrow} \right) |\downarrow,\uparrow\rangle \right\} \\ &= -\frac{t}{\sqrt{2}} \{ |\downarrow\uparrow,0\rangle + |0,\uparrow\downarrow\rangle - |\uparrow\downarrow,0\rangle - |0,\downarrow\uparrow\rangle \} \\ &= 2t \frac{|\uparrow\downarrow,0\rangle - |0,\uparrow\downarrow\rangle}{\sqrt{2}} \\ \mathcal{H} \frac{|\uparrow\downarrow,0\rangle - |0,\uparrow\downarrow\rangle}{\sqrt{2}} &= -\frac{t}{\sqrt{2}} \left\{ \left(c_{2\uparrow}^\dagger c_{1\uparrow} + c_{2\downarrow}^\dagger c_{1\downarrow} \right) |\uparrow\downarrow,0\rangle - \left(c_{1\uparrow}^\dagger c_{2\uparrow} + c_{1\downarrow}^\dagger c_{2\downarrow} \right) |0,\uparrow\downarrow\rangle \right\} + U \frac{|\uparrow\downarrow,0\rangle + |0,\uparrow\downarrow\rangle}{\sqrt{2}} \\ &= -\frac{t}{\sqrt{2}} \{ |\downarrow,\uparrow\rangle - |\uparrow,\downarrow\rangle - |\uparrow,\downarrow\rangle + |\downarrow,\uparrow\rangle \} + U \frac{|\uparrow\downarrow,0\rangle + |0,\uparrow\downarrow\rangle}{\sqrt{2}} \\ &= 2t \frac{|\uparrow,\downarrow\rangle - |\downarrow,\uparrow\rangle}{2} + U \frac{|\uparrow\downarrow,0\rangle - |0,\uparrow\downarrow\rangle}{\sqrt{2}} \end{aligned} \quad (25)$$

$$\begin{array}{c} \frac{|\uparrow,\downarrow\rangle-|\downarrow,\uparrow\rangle}{\sqrt{2}} \\ \frac{|\uparrow\downarrow,0\rangle-|0,\uparrow\downarrow\rangle}{\sqrt{2}} \end{array} \begin{pmatrix} \frac{|\uparrow,\downarrow\rangle-|\downarrow,\uparrow\rangle}{\sqrt{2}} & \frac{|\uparrow\downarrow,0\rangle-|0,\uparrow\downarrow\rangle}{\sqrt{2}} \\ 0 & 2t \\ 2t & U \end{pmatrix} \quad (26)$$

This subspace is not automatically diagonal, but is easily diagonalized. The eigenvectors are

$$\begin{aligned} \frac{1}{N_\pm} \left\{ 2t \frac{(|\uparrow,\downarrow\rangle - |\downarrow,\uparrow\rangle)}{\sqrt{2}} + \frac{U \pm \sqrt{U^2 + 16t^2}}{2} \frac{(|\uparrow\downarrow,0\rangle - |0,\uparrow\downarrow\rangle)}{\sqrt{2}} \right\} \\ N_\pm = \left\{ \frac{U}{2} \left[U \pm \sqrt{U^2 + 16t^2} \right] + 16t^2 \right\}^{\frac{1}{2}} \end{aligned} \quad (27)$$

with eigenvalues $\frac{U \pm \sqrt{U^2 + 16t^2}}{2}$ respectively.

1.7 The total spectrum

The final spectrum is already obtained. One final thing to do is to just add the respective values of $-\mu N$ to the eigenvalues.

2 Exact diagonalization of the Anderson molecule

The Hamiltonian

$$\mathcal{H} = -t \sum_{\sigma} \left(c_{1\sigma}^{\dagger} c_{2\sigma} + c_{2\sigma}^{\dagger} c_{1\sigma} \right) + U \hat{n}_{1\uparrow} \hat{n}_{1\downarrow} + \epsilon_s \sum_{\sigma} \hat{n}_{2\sigma} + \epsilon_d \sum_{\sigma} \hat{n}_{1\sigma} \quad (28)$$

I have two lattice sites, indexed by 1 and 2, occupied by electrons. μ is the chemical potential, $c_{i\sigma}^{\dagger}$ and $c_{i\sigma}$ are the fermionic creation and annihilation operators at the i^{th} site, with spin-index σ . σ can take values \uparrow and \downarrow , denoting spin-up and spin-down states respectively. $\hat{n}_{i\sigma} = c_{i\sigma}^{\dagger} c_{i\sigma}$ is the number operator for the i^{th} site and at spin-index σ ; it counts the number of fermions with the designated quantum numbers. $\hat{N} = \sum_{i\sigma} \hat{n}_{i\sigma}$ is the total number operator; it counts the total number of fermions at all sites and spin-indices. t is the hopping strength; the more the t , the more are the electrons likely to hop between sites. U is the on-site repulsion cost; it represents the increase in energy when two electrons occupy the same site. The model has on-site repulsion only for the first site. The sites have energies of ϵ_s and ϵ_d respectively.

2.1 Symmetries of the problem

The following operators commute with the Hamiltonian.

1. **Total number operator:** $[\mathcal{H}, \hat{N}] = 0$.
2. **Magnetization operator:** $[\mathcal{H}, \hat{S}_{tot}^z] = 0$.
3. **Total Spin Operator:** Total spin angular momentum operator,

$$\hat{S}_{tot}^2 = (\hat{S}_{tot}^x)^2 + (\hat{S}_{tot}^y)^2 + (\hat{S}_{tot}^z)^2 = S_{tot}^+ S_{tot}^- - \hbar S_{tot}^z + (S_{tot}^z)^2 \quad (29)$$

Since all the terms in the Hamiltonian are spin-preserving (all events conserve the number of particles having a definite spin σ), total angular momentum will be conserved. It's obvious that the number operator term do so. The hopping term does so as well; $c_{i\sigma}^{\dagger} c_{j\sigma}$ destroys a particle of spin σ and creates a particle of the same spin; the total angular momentum remain conserved in the process, although the number of particles at a particular site is not conserved. Thus, $[\hat{S}_{tot}^2, \mathcal{H}] = 0$.

2.2 $N = 1$

- $S_{tot}^z = -1$: $|\downarrow, 0\rangle, |0, \downarrow\rangle$
- $S_{tot}^z = +1$: $|\uparrow, 0\rangle, |0, \uparrow\rangle$

2.2.1 $S_{tot}^z = -1$

Let us first see the action of the Hamiltonian on the eigenfunctions with $S_{tot}^z = -1$.

$$\begin{aligned} \mathcal{H} |\downarrow, 0\rangle &= \epsilon_d |\downarrow, 0\rangle - t |0, \downarrow\rangle \\ \mathcal{H} |0, \downarrow\rangle &= \epsilon_s |0, \downarrow\rangle - t |\downarrow, 0\rangle \end{aligned} \quad (30)$$

We get the following matrix for this tiny subspace of the Hamiltonian:

$$\begin{matrix} & |\downarrow, 0\rangle & |0, \downarrow\rangle \\ \begin{matrix} |\downarrow, 0\rangle \\ |0, \downarrow\rangle \end{matrix} & \begin{pmatrix} \epsilon_d & -t \\ -t & \epsilon_s \end{pmatrix} \end{matrix} \quad (31)$$

Eigenvalues: $\frac{1}{2} [\epsilon_d + \epsilon_s \pm \sqrt{(\epsilon_d - \epsilon_s)^2 + 4t^2}]$. For $\epsilon_s = \epsilon_d + \frac{U}{2}$ and $\Delta = \sqrt{U^2 + 16t^2}$, eigenvalues, $\lambda_{\pm} = \epsilon_d + \frac{1}{4}(U \pm \Delta)$.

The eigenvectors are $\frac{1}{N_{\pm}} (t |\downarrow, 0\rangle - \frac{1}{4}(U \pm \Delta) |0, \downarrow\rangle)$, where $N_{\pm}^2 = t^2 + (\frac{U \pm \Delta}{4})^2$

2.2.2 $S_{tot}^z = +1$

$$\begin{aligned} \mathcal{H} |\uparrow, 0\rangle &= \epsilon_d |\uparrow, 0\rangle - t |0, \uparrow\rangle \\ \mathcal{H} |0, \uparrow\rangle &= \epsilon_s |0, \uparrow\rangle - t |\uparrow, 0\rangle \end{aligned} \quad (32)$$

Clearly, this gives the same matrix as the spin-down states. So, the eigenvalues will be exactly the same, and the eigenvectors will be correspondingly modified in the new basis.
eigenvectors : $\frac{1}{N_{\pm}} (t |\uparrow, 0\rangle + (\epsilon_d - \lambda_{\pm}) |0, \uparrow\rangle)$

2.3 N=3

- $S_{tot}^z = -1$: $|\uparrow\downarrow, \downarrow\rangle, |\downarrow, \uparrow\downarrow\rangle$
- $S_{tot}^z = +1$: $|\uparrow\downarrow, \uparrow\rangle, |\uparrow, \uparrow\downarrow\rangle$

2.3.1 $S_{tot}^z = -1$

$$\begin{aligned} \mathcal{H} |\uparrow\downarrow, \downarrow\rangle &= -t |\downarrow, \uparrow\downarrow\rangle + (2\epsilon_d + \epsilon_s + U) |\uparrow\downarrow, \downarrow\rangle \\ \mathcal{H} |\downarrow, \uparrow\downarrow\rangle &= -t |\uparrow\downarrow, \downarrow\rangle + (2\epsilon_s + \epsilon_d) |\downarrow, \uparrow\downarrow\rangle \end{aligned} \quad (33)$$

$$\begin{matrix} & |\uparrow\downarrow, \downarrow\rangle & |\downarrow, \uparrow\downarrow\rangle \\ \begin{matrix} |\uparrow\downarrow, \downarrow\rangle \\ |\downarrow, \uparrow\downarrow\rangle \end{matrix} & \begin{pmatrix} 2\epsilon_d + \epsilon_s + U & -t \\ -t & 2\epsilon_s + \epsilon_d \end{pmatrix} \end{matrix} \quad (34)$$

Again setting $\epsilon_s = \epsilon_d + \frac{U}{2}$, eigenvalues: $3\epsilon_d + \frac{5}{4}U \pm \frac{1}{4}\Delta$.

Corresponding eigenvectors $\frac{1}{N_{\pm}} (t |\uparrow\downarrow, \downarrow\rangle - \frac{1}{4}(U \pm \Delta) |\downarrow, \uparrow\downarrow\rangle)$

2.3.2 $S_{tot}^z = +1$

$$\begin{aligned} \mathcal{H} |\uparrow\downarrow, \uparrow\rangle &= -t |\uparrow, \uparrow\downarrow\rangle + (2\epsilon_d + \epsilon_s + U) |\uparrow\downarrow, \uparrow\rangle \\ \mathcal{H} |\uparrow, \uparrow\downarrow\rangle &= -t |\uparrow\downarrow, \uparrow\rangle + (2\epsilon_s + \epsilon_d) |\uparrow, \uparrow\downarrow\rangle \end{aligned} \quad (35)$$

Again the same matrix. Hence the eigenvalues are same. Eigenvectors are $\frac{1}{N_{\pm}} (t |\uparrow\downarrow, \uparrow\rangle - \frac{1}{4}(U \pm \Delta) |\uparrow, \uparrow\downarrow\rangle)$

2.4 N=2

This is the eigenvalue that has the largest subspace.

- $S_{tot}^z = -1$: $|\downarrow, \downarrow\rangle$
- $S_{tot}^z = +1$: $|\uparrow, \uparrow\rangle$
- $S_{tot}^z = 0$: $|\uparrow, \downarrow\rangle, |\downarrow, \uparrow\rangle, |0, \uparrow\downarrow\rangle, |\uparrow\downarrow, 0\rangle$

2.4.1 $S_{tot}^z = \pm 1$

These two subspaces have a single state each, so they are obviously eigenstates. Since they both have identical spins on both sites, the hopping term is 0, and the U -term is also zero because of single occupation. As a result, they both have zero eigenvalue

$$\mathcal{H}|\downarrow, \downarrow\rangle = \mathcal{H}|\uparrow, \uparrow\rangle = \epsilon_s + \epsilon_d \quad (36)$$

2.4.2 $S_{tot}^z = 0$

This subspace has four eigenvectors,

$$|\uparrow, \downarrow\rangle, \quad |\downarrow, \uparrow\rangle, \quad |0, \uparrow\downarrow\rangle, \quad |\uparrow\downarrow, 0\rangle \quad (37)$$

so it is easier to first find eigenstates of S_{tot}^2 . Since these are states with zero S^z , S_{tot}^2 for these states is just S^+S^-

$$\begin{aligned} S^+S^-|\uparrow, \downarrow\rangle &= S^+S^-|\downarrow, \uparrow\rangle = |\uparrow, \downarrow\rangle + |\downarrow, \uparrow\rangle \\ S^+S^-|\uparrow\downarrow, 0\rangle &= S^+S^-|0, \uparrow\downarrow\rangle = 0 \end{aligned} \quad (38)$$

The eigenstates are

$$\frac{|\uparrow, \downarrow\rangle + |\downarrow, \uparrow\rangle}{\sqrt{2}} (S_{tot}^2 = 1), \quad \left\{ \frac{|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle}{\sqrt{2}}, |\uparrow\downarrow, 0\rangle, |0, \uparrow\downarrow\rangle \right\} (S_{tot}^2 = 0) \quad (39)$$

$S_{tot}^2 = 1$ immediately delivers an eigenstate:

$$\mathcal{H} \frac{|\uparrow, \downarrow\rangle + |\downarrow, \uparrow\rangle}{\sqrt{2}} = (\epsilon_d + \epsilon_s) \left(\frac{|\uparrow, \downarrow\rangle + |\downarrow, \uparrow\rangle}{\sqrt{2}} \right) \quad (40)$$

Next I diagonalize the subspace $S_{tot}^2 = 0$.

$$\begin{aligned} \mathcal{H} \frac{|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle}{\sqrt{2}} &= (\epsilon_d + \epsilon_s) \left(\frac{|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle}{\sqrt{2}} \right) + \sqrt{2}t(|\uparrow\downarrow, 0\rangle - |0, \uparrow\downarrow\rangle) \\ \mathcal{H}|\uparrow\downarrow, 0\rangle &= (2\epsilon_d + U)|\uparrow\downarrow, 0\rangle + \sqrt{2}t \frac{|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle}{\sqrt{2}} \\ \mathcal{H}|0, \uparrow\downarrow\rangle &= (2\epsilon_d + U)|0, \uparrow\downarrow\rangle - \sqrt{2}t \frac{|\uparrow, \downarrow\rangle - |\downarrow, \uparrow\rangle}{\sqrt{2}} \end{aligned} \quad (41)$$

We get the following matrix

$$\begin{pmatrix} 2\epsilon_d + \frac{U}{2} & \sqrt{2}t & -\sqrt{2}t \\ \sqrt{2}t & 2\epsilon_d + U & 0 \\ -\sqrt{2}t & 0 & 2\epsilon_d + U \end{pmatrix} \quad (42)$$

The eigenvectors are

- $|\uparrow\downarrow, 0\rangle - |0, \uparrow\downarrow\rangle : 2\epsilon_d + U$
- $\frac{U-\Delta}{4\sqrt{2}t} \frac{|\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle}{\sqrt{2}} - |\uparrow\downarrow, 0\rangle + |0, \uparrow\downarrow\rangle : 2\epsilon_d + \frac{3}{4}U + \frac{1}{2}\Delta(\frac{U}{2}, t)$
- $\frac{U+\Delta}{4\sqrt{2}t} \frac{|\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle}{\sqrt{2}} - |\uparrow\downarrow, 0\rangle + |0, \uparrow\downarrow\rangle : 2\epsilon_d + \frac{3}{4}U - \frac{1}{2}\Delta(\frac{U}{2}, t)$

2.5 The total spectrum

The final spectrum is already obtained. One final thing to do is to just add the respective values of $-\mu N$ to the eigenvalues.

3 Block diagonalization of a Fermionic Hamiltonian in single Fermion number occupancy basis

3.1 The Problem

You have a system of N spin-half fermions. The corresponding Hamiltonian \mathcal{H}_{2N} comprises $2N$ fermionic single particle degrees of freedom defined in the number occupancy basis of $\hat{n}_{i\sigma} = c_{i\sigma}^\dagger c_{i\sigma}$, for all $[i\sigma] \in [1, N] \times [\sigma, -\sigma]$. The corresponding Hilbert space has a dimension of 2^{2N} . i represents some external degree of freedom like site-index for electrons on a lattice or the electron momentum if we go to momentum-space. This Hamiltonian is in general non-diagonal in the occupancy basis of a certain degree of freedom $N\sigma$. $N\sigma$ can be taken to be any degree of freedom, like say, the first lattice site or the largest momentum (Fermi momentum for a fermi gas). Equivalently, for a general \mathcal{H} , $[\mathcal{H}, \hat{n}_{N\sigma}] \neq 0$. The goal is to diagonalize this Hamiltonian.

Theorem 1. *This Hamiltonian can be transformed using a certain unitary transformation $\hat{U}_{N\sigma}$, into $\overline{\mathcal{H}} = \hat{U}_{N\sigma} \mathcal{H} \hat{U}_{N\sigma}^\dagger$ such that this transformed Hamiltonian is diagonal in the occupancy basis of $\hat{n}_{N\sigma}$. A rephrased statement is, there exists a unitary operator $\hat{U}_{N\sigma}$ such that $[\hat{U}_{N\sigma} \mathcal{H}_{2N} \hat{U}_{N\sigma}^\dagger, \hat{n}_{N\sigma}] = 0$.*

3.2 Warming Up - Writing the Hamiltonian as blocks

The Hamiltonian \mathcal{H}_{2N} in general has off-diagonal terms and can be written as the following general matrix in the occupancy basis of $N\sigma$:

$$\mathcal{H}_{2N} = \begin{matrix} & \begin{matrix} |1\rangle & |0\rangle \end{matrix} \\ \begin{matrix} \langle 1| \\ \langle 0| \end{matrix} & \begin{pmatrix} H_1 & H_2 \\ H_3 & H_4 \end{pmatrix} \end{matrix} \quad (43)$$

where $|1\rangle \equiv |\hat{n}_{N\sigma} = 1\rangle$ (occupied). Note that the H_i are not scalars but matrices(blocks), of dimension half that of \mathcal{H}_{2N} , that is 2^{2N-1} . Its clear that since, for example, $H_2 = \langle 1| \mathcal{H}_{2N} |0\rangle$, we have

$$\mathcal{H}_{2N} = H_1 \hat{n}_{N\sigma} + c_{N\sigma}^\dagger H_2 + H_3 c_{N\sigma} + H_4 (1 - \hat{n}_{N\sigma}) \quad (44)$$

Its trivial to check that this definition of \mathcal{H}_{2N} indeed gives back the mentioned matrix elements. The expression for these matrix elements is quite easy to calculate. First, we define the partial trace over the subspace $N\sigma$

$$Tr_{N\sigma}(\mathcal{H}_{2N}) \equiv \sum_{|N\sigma\rangle} \langle N\sigma | \mathcal{H}_{2N} | N\sigma \rangle \quad (45)$$

The sum is over the possible states of $N\sigma$, that is, $\hat{n}_{N\sigma} = 0$ and $\hat{n}_{N\sigma} = 1$. Applying this partial trace to equation 44, after multiplying throughout with $\hat{n}_{N\sigma}$ from the right, gives

$$Tr_{N\sigma}(\mathcal{H}_{2N} \hat{n}_{N\sigma}) = Tr_{N\sigma} \left[H_1 \hat{n}_{N\sigma} \hat{n}_{N\sigma} + c_{N\sigma}^\dagger H_2 \hat{n}_{N\sigma} + H_3 c_{N\sigma} \hat{n}_{N\sigma} + H_4 (1 - \hat{n}_{N\sigma}) \hat{n}_{N\sigma} \right] \quad (46)$$

Recall the following: $\hat{n}_{N\sigma}^2 = \hat{n}_{N\sigma}$, $(1 - \hat{n}_{N\sigma}) \hat{n}_{N\sigma} = 0$.

Also, since H_i are matrix elements with respect to $\hat{n}_{N\sigma}$, they will commute with the creation and annihilation operators. Hence, $Tr_{N\sigma}(c_{N\sigma}^\dagger H_2 \hat{n}_{N\sigma}) = H_2 Tr_{N\sigma}(c_{N\sigma}^\dagger \hat{n}_{N\sigma}) = 0$, because $c_{N\sigma}^\dagger \hat{n}_{N\sigma} = 0$.

Lastly, $Tr_{N\sigma}(H_3 c_{N\sigma} \hat{n}_{N\sigma}) = H_3 Tr_{N\sigma}(c_{N\sigma} \hat{n}_{N\sigma}) = H_3 Tr_{N\sigma}(\hat{n}_{N\sigma} c_{N\sigma}) = 0$, because $\hat{n}_{N\sigma} c_{N\sigma} = 0$. So,

$$Tr_{N\sigma}(\mathcal{H}_{2N} \hat{n}_{N\sigma}) = Tr_{N\sigma} [H_1 \hat{n}_{N\sigma}] = H_1 Tr_{N\sigma} \hat{n}_{N\sigma} = H_1 \quad (47)$$

This gives the expression for H_1 . Similarly, by taking partial trace of $\mathcal{H}(1 - \hat{n}_{N\sigma})$, $\mathcal{H}c_{N\sigma}$ and $c_{N\sigma}^\dagger \mathcal{H}$, we get the expressions for all the blocks. They are listed here.

$$\begin{aligned} H_1 &\equiv \hat{H}_{N\sigma,e} = Tr_{N\sigma} [\mathcal{H}_{2N} \hat{n}_{N\sigma}] \\ H_2 &\equiv \hat{T}_{N\sigma,e-h} = Tr_{N\sigma} [\mathcal{H}_{2N} c_{N\sigma}] \\ H_3 &\equiv T_{N\sigma,e-h}^\dagger = Tr_{N\sigma} [c_{N\sigma}^\dagger \mathcal{H}_{2N}] \\ H_4 &\equiv \hat{H}_{N\sigma,h} = Tr_{N\sigma} [\mathcal{H}_{2N} (1 - \hat{n}_{N\sigma})] \end{aligned} \quad (48)$$

We get the following block decomposition of the Hamiltonian.

$$\mathcal{H}_{2N} = \begin{array}{c} \begin{array}{cc} |1\rangle & |0\rangle \end{array} \\ \begin{array}{l} \langle 1| \\ \langle 0| \end{array} \end{array} \begin{pmatrix} \hat{H}_{N\sigma,e} & \hat{T}_{N\sigma,e-h} \\ T_{N\sigma,e-h}^\dagger & \hat{H}_{N\sigma,h} \end{pmatrix} = \begin{array}{c} \begin{array}{cc} |1\rangle & |0\rangle \end{array} \\ \begin{array}{l} \langle 1| \\ \langle 0| \end{array} \end{array} \begin{pmatrix} Tr_{N\sigma} [\mathcal{H}_{2N} \hat{n}_{N\sigma}] & Tr_{N\sigma} [\mathcal{H}_{2N} c_{N\sigma}] \\ Tr_{N\sigma} [c_{N\sigma}^\dagger \mathcal{H}_{2N}] & Tr_{N\sigma} [\mathcal{H}_{2N} (1 - \hat{n}_{N\sigma})] \end{pmatrix} \quad (49)$$

$$\begin{aligned} \mathcal{H}_{2N} = Tr_{N\sigma} [\mathcal{H}_{2N} \hat{n}_{N\sigma}] \hat{n}_{N\sigma} + c_{N\sigma}^\dagger Tr_{N\sigma} [\mathcal{H}_{2N} c_{N\sigma}] + Tr_{N\sigma} [c_{N\sigma}^\dagger \mathcal{H}_{2N}] c_{N\sigma} \\ + Tr_{N\sigma} [\mathcal{H}_{2N} (1 - \hat{n}_{N\sigma})] (1 - \hat{n}_{N\sigma}) \end{aligned} \quad (50)$$

3.3 Proof of the theorem

Define an operator $\hat{P}_{N\sigma} = \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \hat{U}_{N\sigma}$. This is the rotated version of the number operator. What this does will be apparent from the following demonstration.

$$\begin{aligned} [\mathcal{H}_{2N}, \hat{P}_{N\sigma}] &= [\mathcal{H}_{2N}, \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \hat{U}_{N\sigma}] = \mathcal{H}_{2N} \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \hat{U}_{N\sigma} - \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \hat{U}_{N\sigma} \mathcal{H}_{2N} \\ &= \hat{U}_{N\sigma}^\dagger \overline{\mathcal{H}_{2N}} \hat{n}_{N\sigma} \hat{U}_{N\sigma} - \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \overline{\mathcal{H}_{2N}} \hat{U}_{N\sigma} = \hat{U}_{N\sigma}^\dagger [\mathcal{H}_{2N}, \hat{n}_{N\sigma}] \hat{U}_{N\sigma} \\ &= 0 \end{aligned} \quad (51)$$

We see that $\hat{P}_{N\sigma}$ is the operator that commutes with the original Hamiltonian. Note that here we are not transforming the Hamiltonian. Instead we are changing the single particle basis; $\hat{P}_{N\sigma}$ is not the single-particle occupation basis $\hat{n}_{N\sigma}$, rather a unitarily transformed version of that. This operator projects out the eigensubspaces of the diagonal Hamiltonian. $\hat{n}_{N\sigma} \mathcal{H}_{2N} \hat{n}_{N\sigma}$ will project out the subspace of the Hamiltonian in which the particle states are occupied, but since the \mathcal{H}_{2N} is not diagonal, these will not be the eigensubspace. Instead, $\hat{P}_{N\sigma} \mathcal{H}_{2N} \hat{P}_{N\sigma}$ will project out the eigensubspace.

Both the approaches are mathematically equivalent; the matrix of \mathcal{H}_{2N} in the basis of $\hat{P}_{N\sigma}$ and the matrix of $\overline{\mathcal{H}_{2N}}$ in the basis of $\hat{n}_{N\sigma}$ will be identical; they will both be block-diagonal with the same blocks in the diagonal.

$\hat{P}_{N\sigma}$ also has the following properties:

- $\hat{P}_{N\sigma}^2 = \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma}^2 \hat{U}_{N\sigma} = \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \hat{U}_{N\sigma} = \hat{P}_{N\sigma}$
- $\hat{P}_{N\sigma} (1 - \hat{P}_{N\sigma}) = \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} (1 - \hat{n}_{N\sigma}) \hat{U}_{N\sigma} = 0$

Let the block-diagonal form of the Hamiltonian be

$$\overline{\mathcal{H}_{2N}} = \begin{pmatrix} \hat{E}_{N\sigma} & 0 \\ 0 & \hat{E}_{N\sigma}' \end{pmatrix} \quad (52)$$

The block diagonal equations for $\overline{\mathcal{H}_{2N}}$ are then, very simply,:

$$\begin{aligned}\overline{\mathcal{H}_{2N}}|1\rangle &= E_{N\sigma}^{\hat{}}|1\rangle \\ \overline{\mathcal{H}_{2N}}|0\rangle &= E_{N\sigma}^{\prime\hat{}}|0\rangle\end{aligned}\tag{53}$$

$|1\rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$ is the eigenstate of $\hat{n}_{N\sigma}$ for the occupied state. Similarly, $|0\rangle$ is the vacant eigenstate. The goal is to construct expressions for the blocks $E_{N\sigma}^{\hat{}}$ and $E_{N\sigma}^{\prime\hat{}}$.

Its easy to see that if any matrix \hat{A} is written in the basis of some operator \hat{m} , $\hat{m}\hat{A}\hat{m}$ returns the upper diagonal element of \hat{A} and $(1 - \hat{m})\hat{A}(1 - \hat{m})$ returns the lower diagonal element. For example, to get the upper diagonal element,

$$\hat{A} = \begin{pmatrix} 1 & -1 \\ 2 & 0 \end{pmatrix} \implies \hat{m}\hat{A}\hat{m} = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \times \begin{pmatrix} 1 & -1 \\ 2 & 0 \end{pmatrix} \times \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}\tag{54}$$

Similarly,

$$\hat{m}\hat{A}(1 - \hat{m}) = \begin{pmatrix} 0 & -1 \\ 0 & 0 \end{pmatrix}, (1 - \hat{m})\hat{A}\hat{m} = \begin{pmatrix} 0 & 0 \\ 2 & 0 \end{pmatrix}, (1 - \hat{m})\hat{A}(1 - \hat{m}) = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}\tag{55}$$

We hence have the equation

$$\begin{aligned}\hat{n}_{N\sigma}\overline{\mathcal{H}_{2N}}\hat{n}_{N\sigma} &= P_{N\sigma}^{\hat{}}\mathcal{H}_{2N}P_{N\sigma}^{\hat{}} = \begin{pmatrix} E_{N\sigma}^{\hat{}} & 0 \\ 0 & 0 \end{pmatrix} \\ (1 - \hat{n}_{N\sigma})\overline{\mathcal{H}_{2N}}(1 - \hat{n}_{N\sigma}) &= (1 - P_{N\sigma}^{\hat{}})\mathcal{H}_{2N}(1 - P_{N\sigma}^{\hat{}}) = \begin{pmatrix} 0 & 0 \\ 0 & E_{N\sigma}^{\prime\hat{}} \end{pmatrix}\end{aligned}\tag{56}$$

Here, we have used the fact that the diagonal blocks remain invariant under unitary transformations.

Define two matrices diagonal in $\hat{n}_{N\sigma}$:

$$\mathcal{H}' = E_{N\sigma}^{\hat{}} \otimes \mathbf{I} = \begin{pmatrix} E_{N\sigma}^{\hat{}} & 0 \\ 0 & E_{N\sigma}^{\prime\hat{}} \end{pmatrix}\tag{57}$$

$$\mathcal{H}'' = E_{N\sigma}' \otimes \mathbf{I} = \begin{pmatrix} E_{N\sigma}' & 0 \\ 0 & E_{N\sigma}' \end{pmatrix} \quad (58)$$

This enables us to derive the following equation between \mathcal{H}_{2N} and \mathcal{H}' :

$$\begin{aligned} \mathcal{H}_{2N} \hat{P}_{N\sigma} &= \mathcal{H}_{2N} \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \hat{U}_{N\sigma} = \hat{U}_{N\sigma}^\dagger \overline{\mathcal{H}_{2N}} \hat{n}_{N\sigma} \hat{U}_{N\sigma} = \hat{U}_{N\sigma}^\dagger \begin{pmatrix} E_{N\sigma}' & 0 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \hat{U}_{N\sigma} \\ &= \hat{U}_{N\sigma}^\dagger \begin{pmatrix} E_{N\sigma}' & 0 \\ 0 & E_{N\sigma}' \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \hat{U}_{N\sigma} = \hat{U}_{N\sigma}^\dagger E_{N\sigma}' \otimes \mathbb{I} \hat{n}_{N\sigma} \hat{U}_{N\sigma} = E_{N\sigma}' \otimes \mathbb{I} \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \hat{U}_{N\sigma} = \mathcal{H}' \hat{P}_{N\sigma} \\ &\therefore \mathcal{H}_{2N} \hat{P}_{N\sigma} = \mathcal{H}' \hat{P}_{N\sigma} \end{aligned} \quad (59)$$

$$\therefore \mathcal{H}_{2N} \hat{P}_{N\sigma} = \mathcal{H}' \hat{P}_{N\sigma} \quad (60)$$

Similar;y, performing the calculation with \mathcal{H}'' gives

$$\therefore \mathcal{H}_{2N} (1 - \hat{P}_{N\sigma}) = \mathcal{H}'' (1 - \hat{P}_{N\sigma}) \quad (61)$$

A general unitary matrix $\hat{U}_{N\sigma}$ has the form (in basis of $\hat{n}_{N\sigma}$)

$$\hat{U}_{N\sigma} = \begin{bmatrix} e^{i\phi_1} \cos \theta & e^{i\phi_2} \sin \theta \\ -e^{-i\phi_2} \sin \theta & e^{-i\phi_1} \cos \theta \end{bmatrix} \quad (62)$$

This provides a form for the matrix of the projection operator in the basis of $\hat{n}_{N\sigma}$:

$$\begin{aligned} \hat{P}_{N\sigma} &= \hat{U}_{N\sigma}^\dagger \hat{n}_{N\sigma} \hat{U}_{N\sigma} = \begin{bmatrix} e^{-i\phi_1} \cos \theta & -e^{i\phi_2} \sin \theta \\ e^{-i\phi_2} \sin \theta & e^{i\phi_1} \cos \theta \end{bmatrix} \times \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} \times \begin{bmatrix} e^{i\phi_1} \cos \theta & e^{i\phi_2} \sin \theta \\ -e^{-i\phi_2} \sin \theta & e^{-i\phi_1} \cos \theta \end{bmatrix} \\ &= \begin{bmatrix} \cos^2 \theta & \cos \theta \sin \theta e^{-i(\phi_1 - \phi_2)} \\ \cos \theta \sin \theta e^{i(\phi_1 - \phi_2)} & \sin^2 \theta \end{bmatrix} \end{aligned} \quad (63)$$

The diagonal terms represent the particle(occupied) and hole(vacant) contributions; owing to symmetry, we set them equal $\cos^2 \theta = \sin^2 \theta = \frac{1}{2}$. Call the off-diagonal elements $\hat{\eta}_{01}$ and $\hat{\eta}_{01}^\dagger$. The final form becomes

$$\hat{P}_{N\sigma} = \frac{1}{2} \begin{bmatrix} 1 & \hat{\eta}_{01}^\dagger \\ \hat{\eta}_{01} & 1 \end{bmatrix} = \frac{1}{2} \left(\mathbf{I} + \eta_{N\sigma} + \eta_{N\sigma}^\dagger \right) \quad (64)$$

$$\mathbf{I} - \hat{P}_{N\sigma} = \frac{1}{2} \begin{bmatrix} 1 & -\hat{\eta}_{01}^\dagger \\ -\hat{\eta}_{01} & 1 \end{bmatrix} = \frac{1}{2} (\mathbf{I} - \eta_{N\sigma} - \eta_{N\sigma}^\dagger) \quad (65)$$

$\hat{\eta}_{N\sigma} = \hat{\eta}_{01} c_{N\sigma}$ is the electron to hole transition operator. $\hat{\eta}_{N\sigma}^\dagger = \hat{\eta}_{01}^\dagger c_{N\sigma}$ is the hole to electron transition operator. Hence, they are defined to have some pretty obvious properties.

1. $\hat{\eta}_{N\sigma}^2 = \hat{\eta}_{N\sigma}^{\dagger 2} = 0$: once an electron or hole has undergone transition, there is no other to transition.
2. $(1 - \hat{n}_{N\sigma})\hat{\eta}_{N\sigma}\hat{n}_{N\sigma} = \eta_{N\sigma}$: this is expected from the fact that $\hat{\eta}_{N\sigma}$ acts with non-zero result only states of particle-number 1, and hence, $\hat{n}_{N\sigma}$ will just give 1; after the action of $\hat{\eta}_{N\sigma}$, we will get a state with hole (particle-number zero), so $(1 - \hat{n}_{N\sigma})$ will just give 1.
3. $\hat{n}_{N\sigma}\hat{\eta}_{N\sigma}(1 - \hat{n}_{N\sigma}) = 0$: this is expected because $1 - \hat{n}_{N\sigma}$ will give non-zero result only on hole states, but those states will give zero when acted upon by $\hat{\eta}_{N\sigma}$, because there won't be any electron to transition from.

These defining properties have many corrolaries in terms of properties of $\hat{\eta}_{N\sigma}$:

- $\hat{n}_{N\sigma}\hat{\eta}_{N\sigma} = \hat{\eta}_{N\sigma}^\dagger\hat{n}_{N\sigma} = 0$: act with $\hat{n}_{N\sigma}$ from left on property 2.
- $\hat{\eta}_{N\sigma}(1 - \hat{n}_{N\sigma}) = (1 - \hat{n}_{N\sigma})\hat{\eta}_{N\sigma}^\dagger = 0$: act with $1 - \hat{n}_{N\sigma}$ from right on property 2.
- $\hat{\eta}_{N\sigma}\hat{n}_{N\sigma} = (1 - \hat{n}_{N\sigma})\hat{\eta}_{N\sigma} = \eta_{N\sigma}$: act with $\hat{n}_{N\sigma}$ from right on property 2.

To construct the diagonalised Hamiltonian and get some properties of the $\eta_{N\sigma}$, we will use equations 60 and 61.

$$\text{First of all, } \mathcal{H}_{2N}\hat{P}_{N\sigma} = \mathcal{H}'P_{N\sigma} \implies \hat{n}_{N\sigma}\mathcal{H}_{2N}\hat{P}_{N\sigma}(1 - \hat{n}_{N\sigma}) = \hat{n}_{N\sigma}\mathcal{H}'\hat{P}_{N\sigma}(1 - \hat{n}_{N\sigma}).$$

The RHS simplifies as

$$\begin{aligned} \hat{P}_{N\sigma}(1 - \hat{n}_{N\sigma}) &= \frac{1}{2}(1 + \eta + \eta^\dagger)(1 - \hat{n}_{N\sigma}) = \frac{1}{2}(1 + \eta^\dagger)(1 - \hat{n}_{N\sigma}) \quad (\because \eta_{N\sigma}(1 - \hat{n}_{N\sigma}) = 0) \\ \therefore \hat{n}_{N\sigma}\mathcal{H}'\hat{P}_{N\sigma}(1 - \hat{n}_{N\sigma}) &= \frac{1}{2}\hat{n}_{N\sigma}\mathcal{H}'(1 + \eta_{N\sigma}^\dagger)(1 - \hat{n}_{N\sigma}) = \frac{1}{2}\mathcal{H}'\eta_{N\sigma}^\dagger \quad (\because \hat{n}_{N\sigma}\eta^\dagger(1 - \hat{n}_{N\sigma}) = \eta^\dagger) \end{aligned} \quad (66)$$

The LHS simplifies as

$$\begin{aligned} \hat{n}_{N\sigma}\mathcal{H}_{2N} &= (\hat{n}_{N\sigma}H_e\hat{n}_{N\sigma} + \hat{n}_{N\sigma}c^\dagger\hat{T} + \hat{n}_{N\sigma}\hat{T}^\dagger c + \hat{n}_{N\sigma}H_h(1 - \hat{n}_{N\sigma})) \\ &= H_e\hat{n}_{N\sigma} + c^\dagger\hat{T} \quad (67) \\ &\left(\because \hat{n}_{N\sigma}c^\dagger = c^\dagger, \hat{n}_{N\sigma}\hat{T}^\dagger c = \hat{T}^\dagger\hat{n}_{N\sigma}c = 0, \hat{n}_{N\sigma}H_h(1 - \hat{n}_{N\sigma}) = H_h\hat{n}_{N\sigma}(1 - \hat{n}_{N\sigma}) = 0 \right) \end{aligned}$$

$$\begin{aligned}
\therefore \hat{n}_{N\sigma} \mathcal{H}_{2N} \hat{P} (1 - \hat{n}_{N\sigma}) &= \frac{1}{2} (H_e \hat{n}_{N\sigma} + c^\dagger \hat{T}) (1 + \eta^\dagger) (1 - \hat{n}_{N\sigma}) \\
&= \frac{1}{2} (H_e \hat{n}_{N\sigma} + H_e \hat{n}_{N\sigma} \eta^\dagger + c^\dagger T + c^\dagger T \eta^\dagger) (1 - \hat{n}_{N\sigma}) \\
&= \frac{1}{2} H_e \hat{n}_{N\sigma} \eta^\dagger (1 - \hat{n}_{N\sigma}) + c^\dagger T (1 - \hat{n}_{N\sigma}) + \frac{1}{2} c^\dagger T \eta^\dagger (1 - \hat{n}_{N\sigma}) \quad (68) \\
&= \frac{1}{2} H_e \hat{n}_{N\sigma} \eta^\dagger + \frac{1}{2} c^\dagger T \\
&(\because \eta^\dagger (1 - \hat{n}_{N\sigma}) = \eta^\dagger, c^\dagger (1 - \hat{n}_{N\sigma}) = c^\dagger, c^\dagger \eta^\dagger = 0)
\end{aligned}$$

Combining the final equations of 66 and 68, we get

$$c_{N\sigma}^\dagger \hat{T}_{N\sigma} + H_e \hat{n}_{N\sigma} \eta_{N\sigma}^\dagger = \mathcal{H}' \eta_{N\sigma}^\dagger \implies \eta_{N\sigma}^\dagger = \frac{1}{\mathcal{H}' - H_e \hat{n}_{N\sigma}} c_{N\sigma}^\dagger \hat{T}_{N\sigma} \quad (69)$$

Defining $\hat{G}_e(\hat{E}_{N\sigma}) = \frac{1}{\mathcal{H}' - H_e \hat{n}_{N\sigma}}$,

$$\eta_{N\sigma}^\dagger = \hat{G}_e(\hat{E}_{N\sigma}) c_{N\sigma}^\dagger \hat{T}_{N\sigma} \quad (70)$$

This expresses the electron-hole transition operator in terms of the eigenblock $\hat{E}_{N\sigma}$.

The expression for η is obtained using $(1 - \hat{n}_{N\sigma}) \mathcal{H}_{2N} \hat{P} \hat{n}_{N\sigma} = (1 - \hat{n}_{N\sigma}) \mathcal{H}' \hat{P} \hat{n}_{N\sigma}$

$$\hat{P} \hat{n}_{N\sigma} = \frac{1}{2} (1 + \eta + \eta^\dagger) \hat{n}_{N\sigma} = \frac{1}{2} (\hat{n}_{N\sigma} + \eta) \quad (\because \eta \hat{n}_{N\sigma} = \eta, \eta^\dagger \hat{n}_{N\sigma} = 0) \quad (71)$$

$$(1 - \hat{n}_{N\sigma}) \mathcal{H}_{2N} = (H_h (1 - \hat{n}_{N\sigma}) + \hat{T}^\dagger c) \quad (72)$$

$$\begin{aligned}
(1 - \hat{n}_{N\sigma}) \mathcal{H}_{2N} \hat{P} \hat{n}_{N\sigma} &= \frac{1}{2} H_h (1 - \hat{n}_{N\sigma}) \eta + \frac{1}{2} \hat{T}^\dagger c \hat{n}_{N\sigma} + \frac{1}{2} \hat{T}^\dagger c \eta = \frac{1}{2} H_h (1 - \hat{n}_{N\sigma}) \eta + \frac{1}{2} \hat{T}^\dagger c \\
&(\because c \hat{n}_{N\sigma} = c, c \eta = 0) \quad (73)
\end{aligned}$$

$$(1 - \hat{n}_{N\sigma}) \mathcal{H}' \hat{P} \hat{n}_{N\sigma} = \frac{1}{2} \mathcal{H}' (1 - \hat{n}_{N\sigma}) \eta = \frac{1}{2} \mathcal{H}' \eta \quad (74)$$

Combining 73 and 74, we get

$$\eta_{N\sigma} = G_h(\hat{E}_{N\sigma}) \hat{T}_{N\sigma}^\dagger c_{N\sigma} \quad (75)$$

where $G_h(\hat{E}_{N\sigma}) = \frac{1}{\mathcal{H}' - H_h (1 - \hat{n}_{N\sigma})}$

The expression for the eigenblock $\hat{E}_{N\sigma}$ is obtained using $\hat{n}_{N\sigma}\mathcal{H}_{2N}\hat{P}\hat{n}_{N\sigma} = \hat{n}_{N\sigma}\mathcal{H}'\hat{P}\hat{n}_{N\sigma}$

$$\begin{aligned}
\hat{n}_{N\sigma}\mathcal{H}_{2N}\hat{P}\hat{n}_{N\sigma} &= \frac{1}{2}(H_e\hat{n}_{N\sigma} + c^\dagger\hat{T})(\hat{n}_{N\sigma} + \eta) = \frac{1}{2}(H_e\hat{n}_{N\sigma} + H_e\hat{n}_{N\sigma}\eta + c^\dagger T\hat{n}_{N\sigma} + c^\dagger T\eta) \\
&= \frac{1}{2}(H_e\hat{n}_{N\sigma} + c^\dagger T\eta) \\
&\quad \left(\because \hat{n}_{N\sigma}\eta = 0, c^\dagger\hat{T}\hat{n}_{N\sigma} = \hat{T}c^\dagger\hat{n}_{N\sigma} = 0\right) \\
\hat{n}_{N\sigma}\mathcal{H}'\hat{P}\hat{n}_{N\sigma} &= \frac{1}{2}\hat{n}_{N\sigma}\mathcal{H}'(\hat{n}_{N\sigma} + \eta) = \frac{1}{2}(\hat{n}_{N\sigma}\mathcal{H}'\hat{n}_{N\sigma} + \hat{n}_{N\sigma}\mathcal{H}'\eta) = \frac{1}{2}\hat{E}_{N\sigma}\hat{n}_{N\sigma} \\
&\quad \left(\because \hat{n}_{N\sigma}\mathcal{H}'\hat{n}_{N\sigma} = \hat{E}_{N\sigma}\hat{n}_{N\sigma}, \hat{n}_{N\sigma}\mathcal{H}'\eta = \mathcal{H}'\hat{n}_{N\sigma}\eta = 0\right)
\end{aligned} \tag{76}$$

Combining,

$$\hat{E}_{N\sigma}\hat{n}_{N\sigma} = H_e\hat{n}_{N\sigma} + c_{N\sigma}^\dagger\hat{T}_{N\sigma}\eta_{N\sigma} \tag{77}$$

The expression for the lower eigenblock $\hat{E}'_{N\sigma}$ is obtained by repeating the last stuff with \mathcal{H}'' :

$$\begin{aligned}
&\mathcal{H}_{2N}(1 - \hat{P}) = \mathcal{H}''(1 - \hat{P}) \\
\Rightarrow (1 - \hat{n}_{N\sigma})\mathcal{H}_{2N}(1 - \hat{P})(1 - \hat{n}_{N\sigma}) &= (1 - \hat{n}_{N\sigma})\mathcal{H}''(1 - \hat{P})(1 - \hat{n}_{N\sigma})
\end{aligned} \tag{78}$$

Now,

$$(1 - \hat{P})(1 - \hat{n}_{N\sigma}) = \frac{1}{2}(1 - \eta - \eta^\dagger)(1 - \hat{n}_{N\sigma}) = \frac{1}{2}((1 - \hat{n}_{N\sigma}) - \eta^\dagger) \tag{79}$$

Therefore,

$$\begin{aligned}
(1 - \hat{n}_{N\sigma})\mathcal{H}_{2N}(1 - \hat{P})(1 - \hat{n}_{N\sigma}) &= \frac{1}{2}(H_h(1 - \hat{n}_{N\sigma}) + \hat{T}^\dagger c)(1 - \hat{n}_{N\sigma} - \eta^\dagger) \\
&= \frac{1}{2}\left(H_h(1 - \hat{n}_{N\sigma}) - \hat{T}^\dagger c\eta^\dagger\right) \\
&\quad \left(\because (1 - \hat{n}_{N\sigma})\eta^\dagger = 0, c(1 - \hat{n}_{N\sigma}) = 0\right) \\
(1 - \hat{n}_{N\sigma})\mathcal{H}''(1 - \hat{P})(1 - \hat{n}_{N\sigma}) &= \frac{1}{2}(1 - \hat{n}_{N\sigma})H''(1 - \hat{n}_{N\sigma}) = \frac{1}{2}\hat{E}'_{N\sigma}(1 - \hat{n}_{N\sigma})
\end{aligned} \tag{80}$$

Combining the last two equations,

$$\hat{E}'_{N\sigma}(1 - \hat{n}_{N\sigma}) = H_h(1 - \hat{n}_{N\sigma}) - \hat{T}_{N\sigma}^\dagger c_{N\sigma}\eta_{N\sigma}^\dagger \tag{81}$$

3.4 A Simple Example

$$\mathcal{H} = -t \left(c_2^\dagger c_1 + c_1^\dagger c_2 \right) + V \hat{n}_1 \hat{n}_2 - \mu (\hat{n}_1 + \hat{n}_2) \quad \hat{n}_i = c_i^\dagger c_i = \begin{pmatrix} V - 2\mu & 0 & 0 & 0 \\ 0 & -\mu & -t & 0 \\ 0 & -t & \mu & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad (82)$$

The basis used is the ordered set $\{|11\rangle, |10\rangle, |01\rangle, |00\rangle\}$

For this problem, we take $N\sigma \equiv 1$. 1 refers to the first site. First step is to represent the Hamiltonian in block matrix form (equation 49).

$$\begin{aligned} \hat{H}_{1,e} &= Tr_1[\mathcal{H}\hat{n}_1] \\ &= Tr_1[V\hat{n}_1\hat{n}_2 - \mu(\hat{n}_1 + \hat{n}_2)] \quad (c \text{ and } c^\dagger \text{ will not conserve the eigenvalue of } \hat{n}) \\ &= V\hat{n}_2 - \mu(1 + \hat{n}_2) \quad (Tr_1[V\hat{n}_1\hat{n}_2] = VTr_1[\hat{n}_1]\hat{n}_2 = V\hat{n}_2) \\ &= (V - 2\mu)\hat{n}_2 - \mu(1 - \hat{n}_2) \end{aligned} \quad (83)$$

Next is calculation of $\hat{H}_{1,h}$:

$$\hat{H}_{1,h} = Tr_1[\mathcal{H}(1 - \hat{n}_1)] = -\mu\hat{n}_2 \quad (84)$$

Next is calculation of $T_{1,e-h}$.

$$\begin{aligned} T_{1,e-h} &= Tr_1[\mathcal{H}c_1] \\ &= Tr_1[-tc_1^\dagger c_2 c_1] = -tc_2 \quad (\text{the only term that conserves eigenvalue of } \hat{n}) \end{aligned} \quad (85)$$

Therefore, $T_{1,e-h}^\dagger = -tc_2^\dagger$. The block matrix form becomes

$$\mathcal{H} = \begin{pmatrix} (V - 2\mu)\hat{n}_2 - \mu(1 - \hat{n}_2) & -tc_2 \\ -tc_2^\dagger & -\mu\hat{n}_2 \end{pmatrix} \quad (86)$$

The block-diagonal form is, as usual, $\overline{\mathcal{H}} = \begin{pmatrix} \hat{E}_1 & 0 \\ 0 & \hat{E}'_1 \end{pmatrix}$

The expression of η^\dagger is $\hat{\eta}^\dagger = \hat{G}_e c_1^\dagger \hat{T}_{1,e-h} = G_e c_1^\dagger (-tc_2)$. Hence, $\eta = -tc_2^\dagger c_1 G_e^\dagger$. Since $H_e^\dagger = H_e$ for this problem, we have $\eta = -tc_2^\dagger c_1 G_e$. It was proved in the formalism that $\eta^\dagger \eta = \hat{n}_1$. Therefore,

$$\begin{aligned} t^2 G_e c_1^\dagger c_2 c_2^\dagger c_1 G_e &= \hat{n}_1 \implies t^2 \hat{n}_1 (1 - \hat{n}_2) = \hat{n}_1 \{G_e^{-1}\}^2 = \hat{n}_1 (\mathcal{H}' - H_e \hat{n}_1)^2 \\ &\implies t^2 \hat{n}_1^2 (1 - \hat{n}_2)^2 = (\mathcal{H}' \hat{n}_1 - H_e \hat{n}_1)^2 \\ &\implies \mathcal{H}' \hat{n}_1 = H_e \hat{n}_1 + t \hat{n}_1 (1 - \hat{n}_2) = (V - 2\mu) \hat{n}_1 \hat{n}_2 + (t - \mu) \hat{n}_1 (1 - \hat{n}_2) \end{aligned} \quad (87)$$

This equation gives the upper block of the diagonalised Hamiltonian. Why the upper block? Because it is multiplied by \hat{n}_1 , and hence can give non-zero contribution only in the upper block. It is also obvious that the upper block itself is internally diagonal in \hat{n}_2 ; this is seen from the fact that the expression of $\mathcal{H}'\hat{n}_1$ has no c_2 or c_2^\dagger , only \hat{n}_2 . The term multiplying \hat{n}_2 becomes the upper matrix element in the block of \hat{n}_2 , while that multiplying $1 - \hat{n}_2$ becomes the lower element. Summarizing,

$$\overline{\mathcal{H}} = \mathcal{H}'\hat{n}_1 + \mathcal{H}''(1 - \hat{n}_1) = \begin{pmatrix} V - 2\mu & 0 & & \\ & 0 & t - \mu & \\ & & & \mathbf{0}_{2 \times 2} \\ & \mathbf{0}_{2 \times 2} & & (\hat{E}'_1)_{2 \times 2} \end{pmatrix} \quad (88)$$

The \hat{E}' is the contribution from \mathcal{H}'' ; just as $\mathcal{H}\hat{n}_1$ gives the upper block contribution, \mathcal{H}'' gives the lower contribution. And since $\mathcal{H}'' = \begin{pmatrix} \hat{E}' & 0 \\ 0 & \hat{E}' \end{pmatrix}$, we end up with \hat{E}' in the lower block of $\overline{\mathcal{H}}$. It still remains to compute $\mathcal{H}''(1 - \hat{n}_1) = \hat{E}'(1 - \hat{n}_1)$. But that is easy because we already have the expression for that, equation 81.

$$E'_1(1 - \hat{n}_1) = H_h(1 - \hat{n}_1) - \hat{T}_1^\dagger c_1 \eta^\dagger = -\mu(1 - \hat{n}_1)\hat{n}_2 - t^2 c_2^\dagger c_1 G_e c_1^\dagger \hat{c}_2 \quad (89)$$

This is the expression for the lower block. But to get the final matrix elements, we need to resolve it in \hat{n}_2 . That is, the upper matrix element of the lower block will be $\langle 01 | E'(1 - \hat{n}_1) | 01 \rangle$ and the lower element will be $\langle 00 | E'(1 - \hat{n}_1) | 00 \rangle$. The bra and ket are written in the notation $\langle n_1, n_2 |, | n_1, n_2 \rangle$. Since this is the lower block in the representation of \hat{n}_1 , n_1 will always be zero while calculating the elements of \hat{E}' . $n_2 = 1(0)$ means the upper(lower) diagonal element. Similarly, $\langle 01 | E'(1 - \hat{n}_1) | 00 \rangle$ is an off-diagonal element.

It is easy to see that the off-diagonal terms will be zero. The lower diagonal term will also be zero: $\hat{n}_2 | n_1, 0 \rangle = c_2 | n_1, 0 \rangle = 0$. Thus the only non-zero term is

$$\langle 01 | E'(1 - \hat{n}_1) | 01 \rangle = -\mu - t^2 \langle 10 | G_e | 10 \rangle \quad (90)$$

Now,

$$\begin{aligned} \langle 10 | G_e^{-1} | 10 \rangle &= \langle 10 | H' - (V - \mu)\hat{n}_1\hat{n}_2 + \mu\hat{n}_1 | 10 \rangle \\ &= \langle 10 | \mathcal{H}' | 10 \rangle + \mu = \langle 10 | \mathcal{H}'\hat{n}_1 | 10 \rangle + \mu \\ &= \langle 10 | (V - 2\mu)\hat{n}_1\hat{n}_2 + (t - \mu)\hat{n}_1(1 - \hat{n}_2) | 10 \rangle + \mu \\ &= t - \mu + \mu = t \\ \therefore \langle 10 | G_e | 10 \rangle &= \frac{1}{t} \end{aligned} \quad (91)$$

Therefore, $\langle 01 | E'(1 - \hat{n}_1) | 01 \rangle = -\mu - t^2 \frac{1}{t} = -\mu - t$. The final diagonalized matrix becomes

$$\overline{\mathcal{H}} = \begin{pmatrix} |11\rangle & |10\rangle & |01\rangle & |00\rangle \\ (V - 2\mu) & 0 & 0 & 0 \\ 0 & (t - \mu) & 0 & 0 \\ 0 & 0 & -(\mu + t) & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad (92)$$

3.4.1 The Eigenstates

The unitarily transformed Hamiltonian, $\overline{\mathcal{H}}$ is diagonal in the basis of \hat{n} . This implies that the eigenstates of the original Hamiltonian \mathcal{H} are the unitarily transformed versions of the eigenkets of \hat{n} :

$$\mathcal{H}(\hat{U}_{N\sigma}^\dagger |n_1, n_2\rangle) = \hat{U}_{N\sigma}^\dagger \overline{\mathcal{H}} |n_1, n_2\rangle = \hat{U}_{N\sigma}^\dagger E_{n_1, n_2} |n_1, n_2\rangle = E_{n_1, n_2} (\hat{U}_{N\sigma}^\dagger |n_1, n_2\rangle) \quad (93)$$

To find the eigenvectors $\hat{U}_{N\sigma}^\dagger |n_1, n_2\rangle$, we need to find the $\hat{U}_{N\sigma}$. From equation ??, we have $\hat{U}_{N\sigma} = \frac{1}{\sqrt{2}} (1 + \hat{\eta}^\dagger - \hat{\eta})$.

To get the eigenstates of \mathcal{H} , I act with U^\dagger on the eigenstates ($|n_1, n_2\rangle$):

$$\hat{U}_{N\sigma}^\dagger |11\rangle = |11\rangle \quad (94)$$

$$\hat{U}_{N\sigma}^\dagger |00\rangle = |00\rangle, \quad (95)$$

$$\begin{aligned} \hat{U}_{N\sigma}^\dagger |10\rangle &= \frac{1}{2} (|10\rangle - \eta |10\rangle) = \frac{1}{2} (|10\rangle + t c_2^\dagger c_1 \hat{G}_e |10\rangle) = \frac{1}{2} \left(|10\rangle + t c_2^\dagger c_1 \frac{1}{t} |01\rangle \right) \\ &= \frac{1}{2} (|10\rangle + |01\rangle) \end{aligned} \quad (96)$$

$$\hat{U}_{N\sigma}^\dagger |01\rangle = \frac{1}{2} (|01\rangle + \eta^\dagger |01\rangle) = \frac{1}{2} (|01\rangle - t \hat{G}_e c_1^\dagger c_2 |01\rangle) = \frac{1}{2} (|01\rangle - |10\rangle) \quad (97)$$

The eigenstates come out to be (upto a normalizaiton):

$$\begin{aligned} &|00\rangle \\ &|10\rangle + |01\rangle \\ &|01\rangle - |10\rangle \\ &|11\rangle \end{aligned} \quad (98)$$

3.5 Applying the RG on the Hubbard dimer

$$\begin{aligned}
\mathcal{H} &= -t \sum_{\sigma} (c_{1\sigma}^{\dagger} c_{2\sigma} + c_{2\sigma}^{\dagger} c_{1\sigma}) + U (\hat{n}_{1\uparrow} \hat{n}_{1\downarrow} + \hat{n}_{2\uparrow} \hat{n}_{2\downarrow}) \\
H_e &= Tr_{\hat{n}_{1\uparrow}} (\mathcal{H} \hat{n}_{1\uparrow}) = U (\hat{n}_{1\downarrow} + \hat{n}_{2\uparrow} \hat{n}_{2\downarrow}) - t (c_{1\downarrow}^{\dagger} c_{2\downarrow} + c_{2\downarrow}^{\dagger} c_{1\downarrow}) \\
H_h &= Tr_{\hat{n}_{1\uparrow}} (\mathcal{H} (1 - \hat{n}_{1\uparrow})) = U \hat{n}_{2\uparrow} \hat{n}_{2\downarrow} - t (c_{1\downarrow}^{\dagger} c_{2\downarrow} + c_{2\downarrow}^{\dagger} c_{1\downarrow}) \\
T &= Tr_{\hat{n}_{1\uparrow}} (\mathcal{H} c_{1\uparrow}) = -t c_{2\uparrow} \\
T^{\dagger} &= Tr_{\hat{n}_{1\uparrow}} (c_{1\uparrow}^{\dagger} \mathcal{H}) = -t c_{2\uparrow}^{\dagger} \\
\eta_{1\uparrow}^{\dagger} &= G_e c_{1\uparrow}^{\dagger} T = -t \hat{G}_e c_{1\uparrow}^{\dagger} c_{2\uparrow} = -t (\mathcal{H}'_{1\uparrow} - H_e \hat{n})^{-1} c_{1\uparrow}^{\dagger} c_{2\uparrow} \\
\therefore \eta_{1\uparrow} &= -t c_{2\uparrow}^{\dagger} c_{1\uparrow} (\mathcal{H}'_{1\uparrow} - H_e \hat{n})^{-1} \\
\eta_{1\uparrow}^{\dagger} \eta_{1\uparrow} &= \hat{n}_{1\uparrow} \implies t^2 (1 - \hat{n}_{2\uparrow}) \hat{n}_{1\uparrow} = (\mathcal{H}'_{1\uparrow} - H_e \hat{n}_{1\uparrow})^2 \hat{n}_{1\uparrow} \implies \mathcal{H}'_{1\uparrow} \hat{n}_{1\uparrow} = H_e \hat{n}_{1\uparrow} + t(1 - \hat{n}_{2\uparrow}) \hat{n}_{1\uparrow} \quad (99) \\
\mathcal{H}'_{1\uparrow} \hat{n}_{1\uparrow} &= U \hat{n}_{1\uparrow} (\hat{n}_{1\downarrow} + \hat{n}_{2\uparrow} \hat{n}_{2\downarrow}) + t \hat{n}_{1\uparrow} (1 - \hat{n}_{2\uparrow} - c_{1\downarrow}^{\dagger} c_{2\downarrow} - c_{1\downarrow} c_{2\downarrow}^{\dagger}) \quad (100)
\end{aligned}$$

The upper block is not diagonal, and has to be further diagonalised. The block is given by

$$\hat{E}_{1\uparrow} = \langle \hat{n}_{1\uparrow} = 1 | \mathcal{H}'_{1\uparrow} \hat{n}_{1\uparrow} | \hat{n}_{1\uparrow} = 1 \rangle = U (\hat{n}_{1\downarrow} + \hat{n}_{2\uparrow} \hat{n}_{2\downarrow}) + t(1 - \hat{n}_{2\uparrow} - c_{1\downarrow}^{\dagger} c_{2\downarrow} - c_{2\downarrow}^{\dagger} c_{1\downarrow}) \quad (101)$$

The lower block, $\mathcal{H}''_{1\uparrow} (1 - \hat{n}_{1\uparrow})$, can be obtained as

$$\mathcal{H}''_{1\uparrow} (1 - \hat{n}_{1\uparrow}) = H_h (1 - \hat{n}_{1\uparrow}) - T^{\dagger} c_{1\uparrow} \eta_{1\uparrow}^{\dagger} = H_h (1 - \hat{n}_{1\uparrow}) - t^2 c_{2\uparrow}^{\dagger} c_{1\uparrow} \hat{G}_e c_{1\uparrow}^{\dagger} c_{2\uparrow} \quad (102)$$

The block itself, $\hat{E}'_{1\uparrow}$, is obtained as

$$\begin{aligned}
E'_{1\uparrow} &= \langle \hat{n}_{1\uparrow} = 0 | \mathcal{H}'' (1 - \hat{n}_{1\uparrow}) | \hat{n}_{1\uparrow} = 0 \rangle \\
&= H_h - t^2 \langle \hat{n}_{1\uparrow} = 0 | c_{2\uparrow}^{\dagger} c_{1\uparrow} \hat{G}_e c_{1\uparrow}^{\dagger} c_{2\uparrow} | \hat{n}_{1\uparrow} = 0 \rangle \\
&= U \hat{n}_{2\uparrow} \hat{n}_{2\downarrow} - t (c_{1\downarrow}^{\dagger} c_{2\uparrow} + c_{2\uparrow}^{\dagger} c_{1\downarrow}) - t^2 c_{2\uparrow}^{\dagger} \langle \hat{n}_{1\uparrow} = 1 | \hat{G}_e | \hat{n}_{1\uparrow} = 1 \rangle c_{2\uparrow}
\end{aligned} \quad (103)$$

Now,

$$\begin{aligned}
\langle \hat{n}_{1\uparrow} = 1 | \hat{G}_e^{-1} | \hat{n}_{1\uparrow} = 1 \rangle &= \langle \hat{n}_{1\uparrow} = 1 | \mathcal{H}'_{1\uparrow} - H_e \hat{n}_{1\uparrow} | \hat{n}_{1\uparrow} = 1 \rangle \\
&= \langle \hat{n}_{1\uparrow} = 1 | \mathcal{H}'_{1\uparrow} \hat{n}_{1\uparrow} - H_e \hat{n}_{1\uparrow} | \hat{n}_{1\uparrow} = 1 \rangle \\
&= \langle \hat{n}_{1\uparrow} = 1 | t \hat{n}_{1\uparrow} (1 - \hat{n}_{2\uparrow}) | \hat{n}_{1\uparrow} = 1 \rangle = t(1 - \hat{n}_{2\uparrow})
\end{aligned} \quad (104)$$

Substituting this in 103 gives

$$E'_{1\uparrow} = U \hat{n}_{2\uparrow} \hat{n}_{2\downarrow} - t (c_{1\downarrow}^{\dagger} c_{2\uparrow} + c_{2\uparrow}^{\dagger} c_{1\downarrow}) - t c_{2\uparrow}^{\dagger} \frac{1}{1 - \hat{n}_{2\uparrow}} c_{2\uparrow} = U \hat{n}_{2\uparrow} \hat{n}_{2\downarrow} - t (c_{1\downarrow}^{\dagger} c_{2\uparrow} + c_{2\uparrow}^{\dagger} c_{1\downarrow} + \hat{n}_{2\uparrow}) \quad (105)$$

$$E'_{1\uparrow} = U \hat{n}_{2\uparrow} \hat{n}_{2\downarrow} - t (c_{1\downarrow}^{\dagger} c_{2\uparrow} + c_{2\uparrow}^{\dagger} c_{1\downarrow} + \hat{n}_{2\uparrow}) \quad (106)$$

3.6 $\hat{n}_{1\uparrow} = 1$ sector

3.6.1 Eigenvalues

To calculate the eigenvalues of the upper block, we take $\hat{E}_{1\uparrow}$ as the new Hamiltonian $\mathcal{H}_{1\downarrow}$ and this time trace out $\hat{n}_{1\downarrow}$.

$$\begin{aligned}
H_{e,\hat{n}_{1\downarrow}} &= \text{Tr}_{\hat{n}_{1\downarrow}}(\mathcal{H}_{1\downarrow}\hat{n}_{1\downarrow}) = U(1 + \hat{n}_{2\uparrow}\hat{n}_{2\downarrow}) + t(1 - \hat{n}_{2\uparrow}) \\
H_{h,\hat{n}_{1\downarrow}} &= U\hat{n}_{2\uparrow}\hat{n}_{2\downarrow} + t(1 - \hat{n}_{2\uparrow}) \\
T &= -tc_{2\downarrow} \\
T^\dagger &= -tc_{2\downarrow}^\dagger \\
\eta_{1\downarrow}^\dagger &= \hat{G}_e c_{1\downarrow}^\dagger T = -t\hat{G}_e c_{1\downarrow}^\dagger c_{2\downarrow} \\
\Rightarrow \eta_{1\downarrow} &= -tc_{2\downarrow}^\dagger c_{1\downarrow} \hat{G}_e
\end{aligned} \tag{107}$$

Then,

$$\eta_{1\downarrow}^\dagger \eta_{1\downarrow} = \hat{n}_{1\downarrow} \Rightarrow \mathcal{H}'_{1\downarrow} \hat{n}_{1\downarrow} = H_{e,\hat{n}_{1\downarrow}} \hat{n}_{1\downarrow} - t\hat{n}_{1\downarrow}(1 - \hat{n}_{2\downarrow}) = U\hat{n}_{1\downarrow}(1 + \hat{n}_{2\uparrow}\hat{n}_{2\downarrow}) - t\hat{n}_{1\downarrow}(\hat{n}_{2\uparrow} - \hat{n}_{2\downarrow}) \tag{108}$$

This gives the upper block of the $\hat{n}_{1\uparrow} = 1$ sector (that is, the $\hat{n}_{1\uparrow} = 1, \hat{n}_{1\downarrow} = 1$ sector); the matrix element is given by $\hat{E}_{1\downarrow} = \langle \hat{n}_{1\downarrow} = 1 | \mathcal{H}'_{1\downarrow} \hat{n}_{1\downarrow} | \hat{n}_{1\downarrow} = 1 \rangle$

$$E_{\hat{n}_{1\downarrow}} = U(\hat{n}_{2\uparrow}\hat{n}_{2\downarrow} + 1) - t(\hat{n}_{2\uparrow} - \hat{n}_{2\downarrow}) = \begin{pmatrix} 2U & & & \\ & U - t & & \\ & & U + t & \\ & & & U \end{pmatrix} \tag{109}$$

The lower block of $\hat{n}_{1\uparrow} = 1$ sector ($\hat{n}_{1\uparrow} = 1, \hat{n}_{1\downarrow} = 0$), that is, $E'_{1\downarrow}$, can again be determined using the formula for the lower blocks.

$$\mathcal{H}''_{1\downarrow} \hat{n}_{1\downarrow} = H_{h,\hat{n}_{1\downarrow}}(1 - \hat{n}_{1\downarrow}) - T^\dagger c_{1\downarrow} \eta_{1\downarrow}^\dagger = H_h(1 - \hat{n}_{1\downarrow}) - t^2 c_{2\downarrow}^\dagger c_{1\downarrow} G_e c_{1\downarrow}^\dagger c_{2\downarrow} \tag{110}$$

The matrix element, $\hat{E}'_{1\downarrow} = \langle \hat{n}_{1\downarrow} = 0 | \mathcal{H}''(1 - \hat{n}_{1\downarrow}) | \hat{n}_{1\downarrow} = 0 \rangle = H_h - t^2 c_{2\downarrow}^\dagger \langle 1 | G_e | 1 \rangle c_{2\downarrow}$

$$\begin{aligned}
\langle 1 | G_e^{-1} | 1 \rangle &= \langle 1 | \mathcal{H}'_{1\downarrow} - H_{e,\hat{n}_{1\downarrow}} \hat{n}_{1\downarrow} | 1 \rangle = \langle 1 | \mathcal{H}'_{1\downarrow} \hat{n}_{1\downarrow} - H_e \hat{n}_{1\downarrow} | 1 \rangle = -t(1 - \hat{n}_{2\downarrow}) \\
\therefore \hat{E}'_{1\downarrow} &= H_h + tc_{2\downarrow}^\dagger \frac{1}{1 - \hat{n}_{2\downarrow}} c_{2\downarrow} = H_h + t\hat{n}_{2\downarrow} = U\hat{n}_{2\uparrow}\hat{n}_{2\downarrow} + t(1 - \hat{n}_{2\uparrow} + \hat{n}_{2\downarrow})
\end{aligned} \tag{111}$$

$$E'_{1\downarrow} = U\hat{n}_{2\uparrow}\hat{n}_{2\downarrow} + t(1 - \hat{n}_{2\uparrow} + \hat{n}_{2\downarrow}) = \begin{pmatrix} U+t & & & \\ & 0 & & \\ & & 2t & \\ & & & t \end{pmatrix} \quad (112)$$

The $\hat{n}_{1\uparrow} = 1$ part of the diagonalised Hamiltonian is

$$E'_{1\hat{n}_{1\downarrow}} = \begin{pmatrix} 2U & & & & & & \\ & U-t & & & & & \\ & & U+t & & & & \\ & & & U & & & \\ & & & & U+t & & \\ & & & & & 0 & \\ & & & & & & 2t \\ & & & & & & & t \end{pmatrix} \quad (113)$$

3.6.2 Eigenvectors

To get the first eight eigenvectors, I first find the eigenvectors in the space of $\hat{n}_{1\downarrow}$. There are 8 eigenvectors in the space of $\hat{n}_{1\downarrow}$, that is $|\hat{n}_{1\downarrow}, \hat{n}_{2\uparrow}, \hat{n}_{2\downarrow}\rangle$. The η for this space is

$$\eta_{1\downarrow} = -tc_{2\downarrow}^\dagger c_{1\downarrow} \hat{G}_e, \quad \eta_{1\downarrow}^\dagger = -t\hat{G}_e c_{1\downarrow}^\dagger c_{2\downarrow} \quad (114)$$

The required eigenvectors are $U_{1\downarrow}^\dagger |\hat{n}_{1\downarrow} \hat{n}_{2\uparrow} \hat{n}_{2\downarrow}\rangle = \frac{1}{2}(1 - \eta_{1\downarrow} + \eta_{1\downarrow}^\dagger) |\hat{n}_{1\downarrow} \hat{n}_{2\uparrow} \hat{n}_{2\downarrow}\rangle$

Note that η acting on $|\hat{n}_{1\downarrow} \hat{n}_{2\uparrow} \hat{n}_{2\downarrow}\rangle$ will give non-zero only when $\hat{n}_{1\downarrow} = 1, \hat{n}_{2\downarrow} = 0$ and η^\dagger will give non-zero only when $\hat{n}_{1\downarrow} = 0, \hat{n}_{2\downarrow} = 1$.

$$\begin{aligned} \eta_{1\downarrow}^\dagger |0, \hat{n}_{2\uparrow}, 1\rangle &= -t\hat{G}_e |1, \hat{n}_{2\uparrow}, 0\rangle = \frac{-t}{\mathcal{H}'_{1\downarrow} - H_{e\hat{n}_{1\downarrow}} \hat{n}_{1\downarrow}} |1, \hat{n}_{2\uparrow}, 0\rangle = \frac{-t}{\mathcal{H}'_{1\downarrow} \hat{n}_{1\downarrow} - H_{e\hat{n}_{1\downarrow}} \hat{n}_{1\downarrow}} |1, \hat{n}_{2\uparrow}, 0\rangle \\ &= \frac{-t}{-t\hat{n}_{1\downarrow}(1 - \hat{n}_{2\downarrow})} |1, \hat{n}_{2\uparrow}, 0\rangle = |1, \hat{n}_{2\uparrow}, 0\rangle \end{aligned} \quad (115)$$

Similarly,

$$\eta_{1\downarrow} |1, \hat{n}_{2\uparrow}, 0\rangle = -tc_{2\downarrow}^\dagger c_{1\downarrow} \hat{G}_e |1, \hat{n}_{2\uparrow}, 0\rangle = -tc_{2\downarrow}^\dagger c_{1\downarrow} \frac{1}{-t} |1, \hat{n}_{2\uparrow}, 0\rangle = |0, \hat{n}_{2\uparrow}, 1\rangle \quad (116)$$

Therefore,

$$\begin{aligned} U_{1\downarrow}^\dagger |1, \hat{n}_{2\uparrow}, 0\rangle &= (1 - \eta_{1\downarrow}) |1, \hat{n}_{2\uparrow}, 0\rangle = |1, \hat{n}_{2\uparrow}, 0\rangle - |0, \hat{n}_{2\uparrow}, 1\rangle \\ U_{1\downarrow}^\dagger |0, \hat{n}_{2\uparrow}, 1\rangle &= (1 + \eta_{1\downarrow}^\dagger) |0, \hat{n}_{2\uparrow}, 1\rangle = |0, \hat{n}_{2\uparrow}, 1\rangle + |1, \hat{n}_{2\uparrow}, 0\rangle \\ U_{1\downarrow}^\dagger |1, \hat{n}_{2\uparrow}, 1\rangle &= |1, \hat{n}_{2\uparrow}, 1\rangle \\ U_{1\downarrow}^\dagger |0, \hat{n}_{2\uparrow}, 0\rangle &= |0, \hat{n}_{2\uparrow}, 0\rangle \end{aligned} \quad (117)$$

Eigenvectors for $\hat{n}_{1\uparrow} = 1$ sector:

$\hat{n}_{1\downarrow}$	$\hat{n}_{2\uparrow}$	$\hat{n}_{2\downarrow}$	Eigenvector	Eigenvalue
1	1	1	$ 111\rangle$	2U
1	1	0	$ 110\rangle - 011\rangle$	U-t
1	0	1	$ 101\rangle$	U+t
1	0	0	$ 100\rangle - 001\rangle$	U
0	1	1	$ 011\rangle + 110\rangle$	U+t
0	1	0	$ 010\rangle$	0
0	0	1	$ 001\rangle + 100\rangle$	2t
0	0	0	$ 000\rangle$	t

Now we need to find the eigenvectors in the space of $\hat{n}_{1\uparrow} = 1$. To do this, we will act with $U_{1\uparrow}^\dagger$ on the previously obtained eigenvectors.

$$\begin{aligned} \eta_{1\uparrow}^\dagger &= -t\hat{G}_e c_{1\uparrow}^\dagger c_{2\uparrow}, \quad \eta_{1\uparrow} = -tc_{2\uparrow}^\dagger c_{1\uparrow} \hat{G}_e \\ \eta_{1\uparrow}^\dagger |\hat{n}_{1\uparrow} = 0, \hat{n}_{1\downarrow}, \hat{n}_{2\uparrow} = 1, \hat{n}_{2\downarrow}\rangle &= -|1, \hat{n}_{1\downarrow}, 0, \hat{n}_{2\downarrow}\rangle \\ \eta_{1\uparrow} |\hat{n}_{1\uparrow} = 1, \hat{n}_{1\downarrow}, \hat{n}_{2\uparrow} = 0, \hat{n}_{2\downarrow}\rangle &= -|0, \hat{n}_{1\downarrow}, 1, \hat{n}_{2\downarrow}\rangle \end{aligned} \quad (118)$$

Applying these on the previously obtained eigenvectors give
